"Consolidated Tax Return" shall have the meaning specified in Section 3.1 of this Agreement.

"Deconsolidation Event" shall mean any event or transaction that causes one or more Sun Jupiter Affiliates to no longer be eligible to file a Consolidated Tax Return or a Combined Tax Return.

"Estimated Payment Date" shall mean each of the due dates prescribed in section 6655(c) of the Code.

"Estimated Tax Sharing Amount" shall have the meaning specified in Section 4.4(a) of this Agreement.

"Federal Income Tax Liability" shall mean, for each taxable period, the Tax liability imposed under Subtitle A of the Code (including the Taxes imposed by section 11 of the Code), and any interest, additions to Tax or penalties applicable or related thereto.

"Final Determination" shall mean the final resolution of any Tax for a taxable period that, under applicable law, is not subject to further appeal, review or modification through proceedings or otherwise.

"Independent Tax Return" shall have the meaning specified in Sections 3.3 and 3.4 of this Agreement.

"Item" shall mean any item of income, gain, deduction, Loss or credit received, earned, paid or incurred by a Sun Jupiter Affiliate.

"Loss" shall mean the excess for a taxable period of a Sun Jupiter Affiliate's deductions for federal or state income Tax purposes over its income for such purposes computed in the manner used to compute its Separate Return Tax Liability (or its State or Local Tax Sharing Amount in the applicable state or local taxing jurisdiction).

"Payment Account" shall have the meaning specified in Section 8 of this Agreement.

"Payment Sections" shall have the meaning specified in Section 8 of this Agreement.

"Pre-Deconsolidation Period" shall mean any taxable period beginning on or before the date of a Deconsolidation Event.

"Separate Return Tax Liability" shall mean, for each taxable period, a Sun Jupiter Consolidated Member's allocable share of the Federal Income Tax Liability of the Sun Jupiter Group determined in accordance with the methodology set forth in sections 1.1552-1(a)(1) and 1.1502-33(d)(3) of the Treasury regulations.

"State Group Head" shall mean Parent or any other Sun Jupiter Affiliate that is the parent of a State Group.

"State or Local Tax Sharing Amount" shall have the meaning specified in Section 5.2 of this Agreement.

"Sun Jupiter Combined Member" shall mean, with respect to any State Group, a Sun Jupiter Affiliate that is included in such State Group and is not a disregarded entity with respect to such State Group.

"Sun Jupiter Consolidated Member" shall mean a Sun Jupiter Affiliate that is a member (within the meaning of section 1.1502-1(b) of the Treasury regulations) of the Sun Jupiter Group.

"Tax" shall mean any federal, state or local tax, impost, rate, charge, fee, duty, levy, or other assessment or charge of any kind whatsoever, together with any related interest, penalties or other additions to tax, imposed by a taxing authority.

"Tax Asset" shall mean any Item that has accrued for Tax purposes, but has not been realized during the taxable period in which it has accrued, and that could reduce a Tax in another taxable period, including a net operating loss, net capital loss, investment tax credit, foreign tax credit, charitable deduction or any other Tax credits.

"Tax Contest" shall have the meaning specified in Section 4.6 of this Agreement.

"Tax Return" shall mean any return, report, certificate, election, form or similar statement or document (including, any related or supporting information or schedule attached thereto and any information return, amended Tax Return, claim for refund or declaration of estimated Tax) supplied to, or filed with, or required to be supplied to, or filed with, a taxing authority in connection with the determination, assessment or collection of any Tax or the administration of any laws, regulations or administrative requirements relating to any Tax.

"Tax Sharing Amount" shall have the meaning specified in Section 4.1 of this Agreement.

2. AGENCY.

Each Sun Jupiter Affiliate hereby designates Parent as its sole and exclusive agent and attorney-in-fact in respect to all matters pertaining to (a) the payment of such Taxes as are imposed in the United States of America and calculated on a consolidated, combined or unitary basis, and (b) compliance with all laws applicable to such Taxes, and hereby authorizes Parent to take on its behalf such action (including execution of documents) as Parent in its sole discretion, may deem appropriate in any and all matters (including audits and other proceedings) relating to any Tax Return described in Sections 3.1 or 3.2 of this Agreement.

3. TAX RETURN PREPARATION.

3.1 Consolidated Federal Tax Returns. Parent shall have exclusive control over all matters relating to the preparation and filing of any consolidated federal income Tax Return of the Sun Jupiter Group (a "Consolidated Tax Return").

3.2 Consolidated, Combined or Unitary State or Local Tax Returns. Parent shall have exclusive control over all matters relating to the preparation and filing of any state or local Tax Return filed on a consolidated, combined, or unitary basis (including, without limitation, any Tax based in whole or in part by net income or gross income or any franchise, gross receipt, net capital or other similar Taxes) with respect to any State Group (a "Combined Tax Return").

3.3 Separately Filed State or Local Income Tax Returns. The applicable Sun Jupiter Affiliate shall have exclusive control over all matters relating to the preparation and filing of any of its state or local income Tax Returns other than any Combined Tax Returns (together with Tax Returns described in Section 3.4 of this Agreement, an "Independent Tax Return").

3.4 Non-Income State or Local Tax Returns. The applicable Sun Jupiter Affiliate shall have exclusive control over all matters relating to the preparation and filing of any of its non-income state or local Tax Returns (together with Tax Returns described in Section 3.3 of this Agreement, an "Independent Tax Return") .

4. ALLOCATION, PAYMENT AND REFUND OF FEDERAL INCOME TAXES.

4.1 Allocation of Federal Income Taxes. For each taxable period, each Sun Jupiter Consolidated Member shall be liable for and pay to Parent (or to such other person as is directed by Parent), at the times and in the manner set forth in Section 4.4 of this Agreement, cash in an amount equal to such Sun Jupiter Consolidated Member's Separate Return Tax Liability (the "Tax Sharing Amount") in order to reimburse Parent for such Sun Jupiter Consolidated Member's allocable share of the Federal Income Tax Liability of the Sun Jupiter Group.

4.2 Payment of the Consolidated Return Tax Liability. Parent shall pay, on behalf of itself and each Sun Jupiter Consolidated Member, to the Internal Revenue Service the Federal Income Tax Liability of the Sun Jupiter Group in the manner specified by the Code and the Treasury regulations promulgated thereunder.

4.3 Use of Items by the Sun Jupiter Group. For the avoidance of doubt, Parent shall pay any Sun Jupiter Consolidated Member for any Item that reduces the Federal Income Tax Liability of the Sun Jupiter Group.

4.4 Payment of Tax Sharing Amounts.

(a) Tax Sharing Installment Payments. Not later than fifteen (15) days prior to an Estimated Payment Date with respect to any taxable period, each Sun Jupiter Consolidated Member shall provide to Parent a reasonable estimate of the related installments of its Federal Income Tax Liability computed as if such Sun Jupiter Consolidated Member files a separate

federal income Tax Return (computed in accordance with any estimated payment method under section 6655 of the Code chosen by Parent) and the basis for such estimate, setting forth the proposed treatment for United States federal income Tax purposes of all Items taken into account in determining such estimate. Parent shall review such estimate, and notify each Sun Jupiter Consolidated Member of any changes to such estimate not later than six (6) days prior to the applicable Estimated Payment Date (such estimate of the related installments, as adjusted by Parent, shall constitute the "Estimated Installment of the Separate Return Tax Liability"). Not later than five (5) days prior to the Estimated Payment Date, each Sun Jupiter Consolidated Member shall pay to Parent (or to such other person as is directed by Parent) the Estimated Installment of the Separate Return Tax Liability (the "Estimated Tax Sharing Amount").

(b) Tax Sharing True-Up Payments. As soon as reasonably practicable after the Consolidated Tax Return for a taxable period is filed, Parent shall deliver to each Sun Jupiter Consolidated Member the information reasonably necessary for such Sun Jupiter Consolidated Member to calculate its Tax Sharing Amount for such taxable period. Within fifteen (15) days after delivery of such information, each Sun Jupiter Consolidated Member shall deliver to Parent a schedule reflecting such Sun Jupiter Consolidated Member's Tax Sharing Amount for such taxable period. Parent shall review such estimate, and shall notify each Sun Jupiter Affiliate of any changes to the schedule as soon as reasonably practicable. Within five (5) days after Parent notifies an Sun Jupiter Consolidated Member of its acceptance of or any changes to the schedule, Parent shall pay to such Sun Jupiter Consolidated Member, or such Sun Jupiter Consolidated Member shall pay to Parent (or to such other person as is directed by Parent), as appropriate, an amount equal to the difference between (i) the sum of the Estimated Tax Sharing Amounts paid by such Sun Jupiter Consolidated Member for such taxable period and (ii) the Tax Sharing Amount set forth with respect to such Sun Jupiter Consolidated Member on the schedule (as adjusted by Parent), together with any interest or penalties assessed on account of such difference by any taxing authority.

4.5 Redetermination of Tax Sharing Amount. If, pursuant to a Final Determination, the treatment of any Item in determining the Sun Jupiter Group's Federal Income Tax Liability for a taxable period is different than that used to calculate any of the Sun Jupiter Consolidated Member's Tax Sharing Amount in respect of such taxable period (including a Final Determination to the effect that a Sun Jupiter Affiliate previously considered an Sun Jupiter Consolidated Member is not an Sun Jupiter Consolidated Member or vice versa), then the amount of any such Tax Sharing Amount (and any Tax Sharing Amounts with respect to prior open years) shall be redetermined by treating such Item in the manner finally determined by Parent, reasonably and in good faith, to be appropriate. The difference between the Tax Sharing Amounts of an Sun Jupiter Consolidated Member and the amounts thereof as redetermined shall be paid within thirty (30) days following such Final Determination by Parent to such Sun Jupiter Consolidated Member, or paid by such Sun Jupiter Consolidated Member to Parent (or to such other person as is directed by Parent), as appropriate, together with interest. Interest shall be computed under section 6621(a)(1) of the Code if the Tax Sharing Amounts are greater than the redetermined amounts, and under section 6621(a)(2) of the Code if the redetermined amounts are greater than the Tax Sharing Amounts. In addition to interest, any such payments shall include penalties which are fairly attributable to the redetermination with respect to such Item.

4.6 Contest. In the event of an audit or administrative or judicial proceeding involving an asserted liability for Taxes (a "Tax Contest") of the Sun Jupiter Group, Parent shall have the sole right to decide whether to contest such Tax Contest, and shall have full control over such Tax Contest. To the extent that a Tax Contest involves an Item attributable to a particular Sun Jupiter Consolidated Member, such member will reimburse Parent for all third-party out-of-pocket expenses associated with such Tax Contest that are attributable to such Item.

4.7 Refunds and Credits. Each Sun Jupiter Consolidated Member shall be entitled to all refunds and credits resulting from an Item attributable to such Sun Jupiter Consolidated Member in determining such member's Tax Sharing Amount. Upon receipt of any refund resulting from an Item attributable to a Sun Jupiter Consolidated Member, Parent shall pay over such refund to the applicable Sun Jupiter Consolidated Member.

5. ALLOCATION, PAYMENT AND REFUND OF STATE AND LOCAL TAXES.

5.1 Elections. Parent, in its sole discretion, may elect to have any State Group file a Combined Tax Return.

5.2 Allocation of State or Local Tax. For each state or local jurisdiction in which a State Group files a Combined Tax Return, each Sun Jupiter Combined Member included in such Combined Tax Return shall be liable for and pay to the applicable State Group Head (or to such other person as is directed by Parent), at the times and in the manner set forth in Section 5.5 of this Agreement, cash in an amount equal to such Sun Jupiter Combined Member's allocable share of the Tax liability of such State Group (the "State or Local Tax Sharing Amount") in order to reimburse such State Group Head for such Sun Jupiter Combined Member's allocable share of the Tax liability of such State Group. For purposes of this Section 5.2, each Sun Jupiter Combined Member's allocable share of the Tax liability of such State Group shall be determined in a manner consistent with the principles set forth in Section 4.1 of this Agreement, subject to any comparable provisions of applicable state or local tax law, if any. Any Tax liability not allocated pursuant to the preceding sentence shall be allocated to each Sun Jupiter Combined Member in a manner as if such Tax liability is separately incurred by such Member.

5.3 Payment of State or Local Tax. As directed by Parent, for each state or local Tax jurisdiction in which a State Group files a Combined Tax Return, the relevant State Group Head shall pay, on behalf of itself and each Sun Jupiter Combined Member included in such State Group, the annual Tax liability of the State Group to the state or local taxing authority in accordance with the laws of the state or local jurisdiction.

5.4 Use of Items by the State Group. For the avoidance of doubt, the State Group Head shall pay any Sun Jupiter Combined Member for any Item that reduces the State Group's Tax liability with respect to its Combined Tax Return.

5.5 Computation and Time of Payment. All payments required under Section 5.2 of this Agreement shall be determined and made in a manner consistent with the principles set forth in Section 4.4 of this Agreement; provided, however, that the timing with respect to each installment of a State or Local Tax Sharing Amount shall be determined by applying the rules specified in Section 4.4(a) of this Agreement to the applicable provisions of the relevant state or local tax law.

5.6 Redetermination. If, pursuant to a Final Determination, the treatment of any Item in determining a State Group's tax liability for a taxable period is different than that used under Section 5.2 of this Agreement to calculate the State or Local Tax Sharing Amounts in respect of such taxable period, such State or Local Tax Sharing Amounts (and any State or Local Tax Sharing Amounts with respect to prior open years) shall be redetermined by Parent, and the Sun Jupiter Affiliates shall make such payments as are necessary to comply with the redetermined amount, in a manner consistent with the principles set forth in Section 4.5 of this Agreement.

5.7 Contest. In the event of any Tax Contest involving a State Group, Parent shall have the sole right to decide whether to contest such Tax Contest, and shall have full control over such Tax Contest. To the extent that a Tax Contest involves an Item attributable to a particular Sun Jupiter Combined Member, such member will reimburse Parent for all third-party out-of-pocket expenses associated with such Tax Contest that are attributable to such Item.

5.8 Refunds and Credits. Each Sun Jupiter Combined Member shall be entitled to all refunds and credits resulting from an Item attributable to such Sun Jupiter Consolidated Member in determining its State or Local Tax Sharing Amount. Upon receipt of any refund resulting from an Item attributable to a Sun Jupiter Combined Member, Parent shall pay over such refund to the applicable Sun Jupiter Combined Member.

6. PAYMENT AND REFUND OF INDEPENDENT TAX RETURNS

6.1 Tax Liability and Payment. Any Sun Jupiter Affiliate required to file an Independent Tax Return shall pay on its own behalf any Tax liability with respect to such Independent Tax Return to the appropriate taxing authority in accordance with the relevant law.

6.2 Contests. In the event of any Tax Contest involving a Sun Jupiter Affiliate with respect to its Independent Tax Returns, such Sun Jupiter Affiliate shall have the sole right to decide whether to contest such Tax Contest, and shall have full control over such Tax Contest.

6.3 Refunds. Each Sun Jupiter Affiliate shall be entitled to all refunds and credits with respect to its Independent Tax Returns.

7. DECONSOLIDATION EVENTS.

7.1 Tax Allocations. Although no Sun Jupiter Affiliate has any plan or intent to effectuate any transaction that would constitute a Deconsolidation Event, the Sun Jupiter Affiliates have set forth how certain Tax matters with respect to a Deconsolidation Event would be handled in the event that, as a result of changed circumstances, a transaction that constitutes a Deconsolidation Event occurs at some future time.

7.2 Allocation of Tax Items. In the case of a Deconsolidation Event, all Tax computations for (1) any Pre-Deconsolidation Periods ending on and including the date of the Deconsolidation Event and (2) the immediately following taxable period of applicable Sun Jupiter Affiliate(s), shall be made pursuant to the principles of section 1.1502-76(b) of the Treasury Regulations or of a corresponding provision under the laws of other applicable jurisdictions, determined by Parent. Parent shall be entitled to make any election allowable under section 1502 of the Code and any Treasury regulations promulgated thereunder in respect of the Deconsolidation Event, including, without limitation, any election pursuant to section 1.1502-36 of the Treasury regulations, and any corresponding provisions under the laws of other applicable jurisdictions, determined by Parent.

7.3 Allocation of Tax Assets. In the case of a Deconsolidation Event, the applicable Sun Jupiter Affiliate and the remaining members of the Sun Jupiter Group shall cooperate in determining the allocation of any Tax Assets among each of the Sun Jupiter Affiliates. All Sun Jupiter Affiliates agree that in the absence of controlling legal authority or unless otherwise provided under this Agreement, Tax Assets shall be allocated to the legal entity that is required under Section 4 and Section 5 of this Agreement to bear the liability for the Tax associated with such Tax Asset, or in the case where no party is required hereunder to bear such liability, the party that incurred the cost or burden associated with the creation of such Tax Asset.

8. RESTRICTION ON PAYMENTS.

If an Sun Jupiter Affiliate is prohibited from making a payment as required by Section 4 or Section 5 of this Agreement by law or contractual obligation, and such prohibition is so acknowledged by Parent, then no such payment will be made under such Sections (collectively, the "Payment Sections"). Parent shall, however, keep an account reflecting the net balance of payments that would have been made had payments been made under the Payment Sections (the "Payment Account"). For purposes of keeping such account, interest shall be computed under section 6621(a)(1) of the Code if money is owed to Parent and under section 6621(a)(2) of the Code if money is owed to an Sun Jupiter Affiliate. If a prohibition referenced in the first sentence of this Section 8 is eliminated, then the affected Sun Jupiter Affiliate shall notify Parent in a timely manner, and within ten (10) days of such notification the amount reflected in the Payment Account shall be paid to Parent or the Sun Jupiter Affiliate, as appropriate.

9. CHANGE IN LAW.

If, after the date this Agreement is executed and delivered, as a result of an amendment to the Code, the promulgation of proposed, temporary or final regulations, the issuance of a ruling by the Internal Revenue Service, the decision of any court, or a change in any comparable applicable state or local Tax law, Parent believes that it is necessary or helpful to amend the provisions of this Agreement in order to preserve the rights and benefits contemplated herein, each of the Sun Jupiter Affiliates agrees to negotiate in good faith all such amendments and modifications as shall be necessary or appropriate in order to preserve as nearly as possible for the Sun Jupiter Affiliates the rights and benefits contemplated herein. Notwithstanding the preceding sentence, in the event of an amendment to section 6655(c) of the Code (or a comparable provision under state or local Tax law), this Agreement shall be amended so that the timing and amounts of Tax Sharing Amounts and/or State or Local Tax Sharing Amounts shall be revised to conform to such amendment.

10. COOPERATION.

Each Sun Jupiter Affiliate shall: (i) furnish Parent or the applicable State Group Head in a timely manner such information and documents as Parent or the applicable State Group Head may request for purposes of (A) preparing any Tax Return for which Parent or the applicable State Group head has filing responsibility under this Agreement, (B) evaluating, contesting, or defending any Tax Contest, and (C) making any determination or computation necessary or appropriate under this Agreement; (ii) make its employees available to provide explanations of documents and other materials and such other information as Parent or the applicable State Group Head may reasonably request in connection with the foregoing; (iii) cooperate in any Tax Contest of a Consolidated Tax Return or Combined Tax Return; (iv) retain and provide on demand books, records, documentation, or other information relating to any Tax Return until ninety (90) days after the expiration of the applicable statute of limitations (giving effect to any extension, waiver, or mitigation thereof); and (v) take such other actions as Parent or the applicable State Group Head may reasonably deem appropriate in connection therewith.

11. GENERAL PROVISIONS.

11.1 Governing Law. This Agreement shall be governed by and construed in accordance with the laws of the State of Delaware.

11.2 Notices. All notices or other communications required or permitted hereunder shall be in writing and shall be deemed given or delivered when delivered personally or when sent by registered or certified mail in accordance with the names and addresses shown on Schedule A, or in accordance with such name and address as a Sun Jupiter Affiliate may indicate by a notice delivered to the other Sun Jupiter Affiliates.

11.3 Successors and Assigns. This Agreement shall be binding upon and inure to the benefit of all the Sun Jupiter Affiliates and their respective successors and assigns. Nothing herein, expressed or implied, is intended or may be construed to confer upon any person other than the Sun Jupiter Affiliates and their successors and assigns any right, remedy or claim under or by reason of this Agreement.

11.4 Duration. Unless terminated earlier by agreement of all Sun Jupiter Affiliates, this Agreement shall remain in force and effect for all taxable periods for which any Sun Jupiter Group files Consolidated Tax Returns or any State Group files Combined Tax Returns. Notwithstanding any termination of this Agreement, the provisions hereof shall remain in effect (and each Sun Jupiter Affiliate shall continue to have all of the rights and obligations hereunder) with respect to any taxable period (or portion thereof) preceding the date of such termination.

11.5 New Affiliates. If at any time any other entity becomes an affiliate of Parent or the applicable State Group Head, such entity may become a party to this Agreement by executing together with Parent or the applicable State Group Head an agreement in substantially the same form as set forth in Schedule B. Unless otherwise specified, such new entity shall have all rights and obligations of an Sun Jupiter Affiliate under this Agreement.

11.6 Affiliates. Each Sun Jupiter Affiliate shall cause to be performed, and hereby guarantees the performance of, all actions, agreements and obligations set forth herein to be performed by any of the Sun Jupiter Affiliates.

11.7 Authorization, Etc. Each of the Sun Jupiter Affiliates hereby represents and warrants that is has the power and authority to execute, deliver and perform this Agreement, that this Agreement has been duly authorized by all necessary corporate action on the part of such Sun Jupiter Affiliate, that this Agreement constitutes a legal, valid and binding obligation of such Sun Jupiter Affiliate and that the execution, delivery and performance of this Agreement by such Sun Jupiter Affiliate does not contravene or conflict with any provision of law or of its charter or bylaws or any agreement, instrument or order binding on such Sun Jupiter Affiliate.

11.8 Entire Agreement; Amendments. This Agreement contains the entire understanding of the Sun Jupiter Affiliates with respect to the subject matter hereof and supersedes all prior agreements, understandings and intentions between or among any of the Sun Jupiter Affiliates. The Sun Jupiter Affiliates may amend, modify or supplement this Agreement, but only by mutual agreement in writing.

11.9 Headings. The headings and subheadings used in this Agreement are used for convenience of reference only and are not to be considered in construing or interpreting this Agreement.

11.10 Counterparts. This Agreement may be executed in two or more counterparts, each of which shall be deemed an original, but all of which together shall constitute one and the same instrument.

EL PASO ELECTRIC COMPANY
DIRECT TESTIMONY OF
VICTOR MARTINEZ

I. INTRODUCTION AND QUALIFICATIONS

Q1. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Victor Martinez, and my business address is 100 N. Stanton Street, El Paso, Texas 79901.

Q2. HOW ARE YOU EMPLOYED?

A. I am employed by El Paso Electric Company ("EPE" or "Company") as the Director of Energy Resources.

Q3. PLEASE SUMMARIZE YOUR EDUCATIONAL AND BUSINESS BACKGROUND.

A. In 2004, I graduated from the University of Texas at El Paso with a Bachelor of Business Administration degree in Computer Information Systems and International Business.

In April 2005, I began working for EPE in the position of Real Time Power Marketer, where my duties included evaluating and balancing EPE's bulk electrical system through the hourly purchase and sale of energy in the wholesale market. In addition, my duties included the purchase of supplemental power to decrease generation costs for EPE customers while working closely with EPE's System Operations and Power Generation divisions to maintain a reliable, safe, and cost-effective electrical system.

In May 2012, I was promoted to Senior Forward Marketer for Long-term Trading and Fuels. The Long-term Trading and Fuels group is responsible for long-term wholesale power transactions, natural gas contract negotiations, and PROMOD model base cases for financial planning. My duties as a Forward Marketer included procuring natural gas on a monthly and mid-term basis, assisting with nuclear fuel contracts, and estimating long-term natural gas requirements, along with future market prices, to maintain an economic and reliable fuel supply.

In May 2014, I was promoted to Interim Supervisor for Real Time Trading. In that capacity, I oversaw operations for all real-time power trading activity.

In August 2014, I was promoted to Supervisor of Day Ahead and Long-Term Trading. My responsibilities included maximizing the value of EPE's assets through power sales and purchases, system fuel purchases, renewable energy certificates ("RECs"), and emissions transactions. I also oversaw the analyses and evaluations of potential day-ahead, intermediate, and long-term agreements for purchase and sale of energy. I supervised the development and evaluation of standard and non-standard deal structures to maximize EPE's resources and minimize fuel and purchased power costs. Additionally, I provided guidance in negotiations of inter-utility, power marketer, fuel provider, and power producer contractual matters.

In January 2020, I was promoted to Manager of Resource Planning, Resource Management Regulatory and Quality Assurance. My responsibilities included managing and supervising the Resource Planning department, which is responsible

for leading EPE's resource planning duties to meet Renewable Energy Act ("REA") responsibilities and activities to obtain an optimal mix of supply-side and demand-side resources that cost-effectively and reliably meet the Company's near-term and long-term forecasted annual peak and energy demand requirements. In that capacity, I interfaced with EPE's Economic Forecasting, Transmission, Operations, Regulatory, and Energy Efficiency departments, among others, and stakeholder groups to incorporate short-term and long-term considerations into EPE's Integrated Resource Plan ("IRP"). Furthermore, I managed and supported EPE's Resource Planning's Request for Proposal ("RFP") processes to identify, select, procure, and implement new generation resources to fulfill EPE's dual obligations to meet New Mexico's incremental renewable portfolio standard ("RPS") requirements and to continue providing safe, reliable and cost-effective electricity to meet EPE's customer demand. In this capacity, I verified the inputs into the Company's PLEXOS and AURORA capacity expansion models and assisted with and corroborated the reasonableness of those analyses. In September 2023, I was promoted to my current role as Director of Energy Resources.

Q4. PLEASE DESCRIBE YOUR PRINCIPAL AREAS OF RESPONSIBILITY IN YOUR CURRENT ROLE OF EPE DIRECTOR OF ENERGY RESOURCES.

A. In my current role, I act in a supervisory capacity over Company employees responsible for the sales and purchases of power in the energy imbalance, real-time,

day ahead, intermediate, and long-term power markets, fuel procurement and strategy, RECs, and emission allowances. My primary responsibilities are to ensure that my team follows the Company's Energy Resources Policies and Procedures approved by executive management when entering into these transactions. The Energy Resource Policies and Procedures are designed to guide the identification of opportunities that optimize the Company's energy resources while reducing fuel and purchased power costs, ultimately delivering cost savings and benefits to our customers. However, we routinely strategize and explore solutions to manage higher penetration of renewables on EPE's system as EPE progresses toward New Mexico's clean energy goals.

I also regularly represent the Company in regulatory proceedings and processes in its Texas and New Mexico jurisdictions as well as at the Federal Energy Regulatory Commission ("FERC"). Lastly, I am responsible for and oversee EPE's ownership stake in the Palo Verde Generating Station ("Palo Verde" or "PVGS"), which includes participating in Owner committee meetings, reviewing and approving capital and operations and maintenance ("O&M") budgets, monitoring plant performance, and ensuring that EPE's interests are represented in operational and strategic decisions. My oversight also involves evaluating major capital projects, compliance with regulatory requirements, and long-term planning to maintain the reliability and economic value of this critical resource for EPE's customers.

Q5. HAVE YOU PREVIOUSLY PRESENTED TESTIMONY BEFORE REGULATORY BODIES?

A. Yes, I have testified before the New Mexico Public Regulation Commission ("NMPRC" or "Commission") and the Public Utility Commission of Texas.

II. PURPOSE OF TESTIMONY

Q6. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. The purpose of my testimony is to provide support for the reasonableness of: capacity costs associated with three battery energy storage systems ("BESS"); capital additions placed in service at Palo Verde since EPE's last rate case, Case No. 20-00104-UT ("2020 Rate Case"), and Palo Verde O&M expenses; and miscellaneous issues addressed in the last section of my testimony. Additionally, I sponsor or co-sponsor certain schedules filed as part of this case, identified below.

Q7. HOW IS YOUR TESTIMONY ORGANIZED?

A. My testimony is presented in four sections. The first section describes EPE's resource mix used to meet its dual obligations to serve New Mexico load and to progress toward the State's clean energy mandates. This section provides context for the capacity costs, investments, and O&M expenses addressed in my testimony and the testimony of other EPE witnesses.

The next section of my testimony describes and supports the reasonableness of annual capacity costs incurred pursuant to Commission approved agreements for three BESS facilities – the Buena Vista Energy Center 1 BESS ("BV1 BESS"), the Santa Teresa Energy Storage Project ("Santa Teresa BESS"), and the Carne Energy Storage Project ("Carne BESS") – that EPE is seeking to include in its proposed base rates. EPE witness Julissa I. Reza addresses and supports the deferred BV1 capacity cost amounts incurred by EPE under the Commission approved purchased power agreement ("PPA") since that facility went into operation in 2023, and EPE witness Adrian Hernandez addresses jurisdictional allocation.

The third section of my testimony describes and supports the capital additions placed in service at Palo Verde since the 2020 Rate Case, through the end of the September 30, 2025 Base Period, as adjusted for October 2025. I also address and support the reasonableness of Palo Verde Test Year Period O&M expenses.

The fourth section of my testimony first supports the reasonableness of investments related to recent upgrades to EPE's Energy Management System ("EMS") which supports EPE's participation in the Energy Imbalance Market ("EIM"). I then describe a life extension analysis for Newman Unit 3 to provide additional support for capital additions for that unit addressed in the Direct Testimony of EPE witness Jeffery M. Hughes.

Q8. WHAT RULE 530 SCHEDULES DO YOU SPONSOR OR CO-SPONSOR?

A. The schedules I sponsor, or co-sponsor are listed below:

- Schedule P-11: Reserve Margin Information—provides details on the Company's reserve margin calculations and supporting data.
- Schedule E-3: Fuel Inventories by Plant Location—presents the fuel inventory balances for each generating facility
- Schedule H-2: Cost of Fuel—details the cost components and calculations for fuel used during the Base Period.
- Schedule P-7: Power Plant Maintenance Information—summarizes maintenance activities and expenditures for the Company's power plants.

My involvement in these schedules supports my testimony regarding resource adequacy, fuel management, and operational reliability.

III. OVERVIEW OF EPE'S NEW MEXICO RESOURCES

Q9. AS DIRECTOR OF ENERGY RESOURCES, WHAT IS YOUR ROLE IN ENSURING THAT EPE MEETS CUSTOMER DEMAND?

A. As Director of Energy Resources, I am responsible for overseeing the operation and optimization of EPE's generation assets and energy procurement to ensure reliable service for our customers. I supervise the team that manages the real-time and day-ahead dispatch of EPE's generation resources, making sure that units are committed

and dispatched in a manner that meets customer demand while respecting transmission constraints, reliability standards, and cost-effectiveness. This includes making unit commitment decisions based on forecasted load, resource availability, fuel economics, and system reliability requirements.

In this role I also ensure that EPEs' fuel supplies, such as natural gas and nuclear fuel, are procured and managed efficiently to support reliable generation and minimize costs. My team also actively participates in regional energy markets, including the California Independent System Operator EIM to optimize power purchases and sales, respond to market price signals, and leverage opportunities for cost savings.

Another key part of my role is ensuring compliance with regulatory requirements and company policies. When regulatory changes occur, such as changes to EPE's RPS requirements or market rules, I guide the department in adapting strategies and procedures to maintain compliance and operational excellence. I also promote continuous improvement by encouraging ongoing evaluation of system performance, operational practices, and emerging technologies to identify opportunities for efficiency gains, cost reductions, and enhanced reliability. Through these activities, I help ensure that EPE meets customer demand with safe, reliable, and affordable electricity while also meeting increasing RPS requirements.

Q10. PROVIDE AN OVERVIEW OF RESOURCES USED TO SERVE NEW MEXICO LOAD.

A. EPE utilizes a diverse portfolio of resources to meet the dual obligations to reliably serve its New Mexico customers and meet the incremental RPS requirements under the Renewable Energy Act. EPE operates a fleet of local generating units within New Mexico and the surrounding region which are interconnected to EPE's transmission network and provide essential capacity and energy for native load. The Direct Testimony of EPE witness Hughes addresses the specifics of EPE's local generation fleet, including operational performance and recent capital additions.

In addition to local generation, EPE's resource portfolio includes remote generation, most notably its ownership interest in PVGS located in Arizona. PVGS provides significant baseload, carbon-free energy—representing approximately 40% of EPE's total energy mix. My testimony in Section V provides a detailed discussion of PVGS operations, capital investments, and its role in supporting EPE's resource adequacy.

To meet both customer demand and the incremental RPS, EPE also contracts with third-party providers for renewable energy and energy storage. These contracts include utility-scale solar and BESS, which are integrated into EPE's supply mix. EPE routinely engages in competitive solicitations to procure additional resources to meet New Mexico's increasing RPS requirements while

ensuring reliability and affordability for customers. The resource selections from these solicitations have included long-term contracts for projects that provide firm capacity and renewable energy to EPE's system. As discussed in more detail below, EPE has added renewable energy and energy storage resources since the last rate case and continues to evaluate additional opportunities to expand its renewable energy resource portfolio.

EPE also supplements its owned and contracted resources with market purchases, leveraging regional energy markets to ensure reliability and cost-effectiveness. Market purchases are used to balance supply and demand, especially during periods of peak load or resource outages. Through this integrated strategy, EPE ensures safe, reliable, and affordable service for New Mexico customers while meeting the state's increasing RPS requirements.

Q11. HOW DOES EPE OPERATE THE SYSTEM?

A. EPE operates its system as an integrated system and dispatches its resources to reliably and economically serve customer demand. On a real-time basis, EPE utilizes a combination of its own generating units, market purchases, purchased power agreements, and energy storage agreements to meet system load while maintaining compliance with applicable reliability standards.

EPE uses security-constrained economic dispatch ("SCED"), which considers both system reliability constraints and economic factors, when

determining the commitment and dispatch of generation resources. Under SCED, EPE evaluates available resources, transmission limitations, real-time operating conditions, and market opportunities to ensure that customer load is served at the lowest reasonable cost while maintaining the reliable operation of EPE's bulk electric system.

EPE's system operations also coordinate with regional entities and neighboring utilities to ensure appropriate interchange scheduling, contingency planning, and real-time situational awareness. This includes dispatching participating units through the EIM when economic opportunities exist, while retaining operational control of EPE's own transmission system.

Q12. HOW HAS THE NEW MEXICO RPS IMPACTED EPE'S RESOURCE MIX SINCE THE 2020 RATE CASE?

A. The increase in RPS from no less than 15 percent of EPE's total retail sales to New Mexico customers in 2019 to 40 percent in 2025 impacts EPE's resource mix.

EPE has expanded its renewable energy portfolio through new procurements selected through a competitive solicitation process. The Company issued RFPs in 2021 and 2023 to procure short-term and/or long-term cost effective reliable electric resources to meet its RPS goals. The Commission has already approved the following three large-scale solar and BESS projects selected from those RFPs to serve New Mexico customers. The BV1 Project, operational in 2023,

provides 100 MW solar and 50 MW battery storage to EPE's system jurisdictionally allocated between Texas and New Mexico. The Carne Project and the Santa Teresa Project, projected to be online in 2026, will increase the solar energy and battery storage to New Mexico. The Commission has also approved the Buena Vista 2 Project which also came online in 2023 and provides 20 MW of solar energy annually to New Mexico customers.

The Company has also added renewable energy to its power supply portfolio through the expansion of community solar and distributed generation. The temporary reallocation of resources between jurisdictions have further diversified EPE's resource portfolio. In response to notices that the Hecate Project which had been an approved REA plan procurement would not become operational, and the Carne Project would be delayed, EPE obtained Commission authorization to temporarily reallocate energy and RECs from Texas to New Mexico customers.

The new resources projected to come online in 2026, together with the Company's ongoing resource planning efforts, position EPE to meet its RPS targets through 2029. EPE's 2025 IRP[1] outlines a long-term strategy for progressing beyond these targets, incorporating additional renewable resources and storage to achieve higher RPS percentages in alignment with New Mexico's clean energy goals.

[1] NMPRC Case No. 24-00260-UT, *El Paso Electric Company's Integrated Resource Plan Filing for the Period of 2025-2044 Pursuant to 17.7.3 NMAC* (Sept. 2, 2025).

Q13. HOW DOES ENERGY STORAGE SUPPORT EPE'S DUAL OBLIGATIONS TO SERVE LOAD AND MEET NEW MEXICO RPS?

A. Energy storage is a critical component of EPE's strategy to meet both increasing customer demand and New Mexico's RPS requirements. According to EPE's 2025 IRP, BESS are increasingly required to be deployed alongside new solar resources, such as the Buena Vista, Carne, and Santa Teresa projects, to provide firm capacity and operational flexibility. Storage allows EPE to shift renewable generation—especially solar—into the evening "net peak" hours when customer demand remains high but solar output declines. This helps EPE maximize the use of renewable energy, reduce curtailment, ensure reliability, and maintain grid reliability.

However, the 2025 IRP also makes clear that current battery storage technologies have limitations. Most BESS installations are designed for 4-hour or 8-hour durations, which means they can provide firming and load shifting for short periods but cannot sustain output through extended periods of low renewable production, such as multi-day weather events or prolonged system peaks. As a result, while energy storage is essential for integrating higher levels of renewables and supporting RPS compliance, it cannot fully replace the need for dispatchable gas generation at this time. EPE's modeling shows that a balanced portfolio—including storage, renewables, and local gas generation—is necessary to ensure

reliability and cost-effectiveness as the resource mix evolves.

Q14. DOES EPE'S LOCAL GAS GENERATION CONTINUE TO BE USED AND USEFUL FOR NEW MEXICO SERVICE IN LIGHT OF INCREASED RELIANCE ON RENEWABLE RESOURCES?

A. Yes. The 2025 IRP confirms that local gas generation remains a vital part of EPE's resource mix for New Mexico, even as renewable penetration increases. Gas-fired units such as Montana, Newman, and Rio Grande provide essential dispatchable capacity, system stability, and backup during periods when renewable output is insufficient or intermittent. The 2025 IRP's resource adequacy modeling and load/resource tables show that, under all scenarios—including aggressive adoption of renewables and storage—local gas generation is still required to meet peak demand, maintain planning reserve margins, and respond to system contingencies.

Moreover, the 2025 IRP highlights that gas generation offers operational flexibility that batteries and renewables alone cannot yet provide, especially for multi-day reliability events or during extreme weather. As EPE transitions toward a cleaner portfolio, local gas generation will continue to play a key role in ensuring reliable service for New Mexico customers.

Q15. IS THERE OTHER DATA TO DEMONSTRATE THE ONGOING NEED FOR LOCAL GAS GENERATION FOR THE PROVISION OF RELIABLE

SERVICE TO EPE'S NEW MEXICO CUSTOMERS?

A. Yes. EPE's load curves presented in the 2025 IRP, included as Exhibit VM-2 to my testimony, clearly demonstrate the ongoing need for local gas generation to provide reliable service. EPE's load curves, which include the Company's top system peak hours, a representative summer day load profile, and a net-load illustration, demonstrate that system demand remains high during evening periods when solar generation is declining or unavailable, underscoring the continued need for local dispatchable generation to provide reliable service to EPE's New Mexico customers. EPE is a summer-peaking utility, with system peaks typically occurring in the late afternoon and early evening, precisely when solar generation is declining or unavailable. The 2025 IRP's typical daily load profiles for residential, commercial, and industrial customers show that the "net peak" period, when demand remains high but renewable output drops, is when local gas generation is most critical.

The 2025 IRP's modeling further shows that, even with substantial additions of renewables and storage, there are periods—such as extended cloudy days, low-wind events, or multi-day heat waves—when battery storage alone cannot meet sustained demand. During these times, local gas units are dispatched to maintain system reliability, provide voltage support, and respond to contingencies. The 2025 IRP's Effective Load Carrying Capability ("ELCC") analysis confirms that while storage and renewables contribute to reliability, they

cannot fully replace the operational flexibility and sustained output of gas generation.

In summary, EPE's load curves and resource adequacy analysis confirm that local gas generation remains necessary for reliable service to New Mexico customers, especially as the system transitions to higher levels of renewable energy.

IV. BESS CAPACITY CHARGES

Q16. WHAT IS EPE REQUESTING WITH RESPECT TO BESS COSTS IN THIS RATE CASE?

A. EPE is seeking to include the annual capacity charges for three BESS projects—BV1 BESS, Carne BESS, and Santa Teresa BESS—in its proposed base rates. EPE is also seeking recovery of the capacity costs EPE has already incurred under the BV1 PPA since that resource came online in 2023. These BESS resources are critical for meeting New Mexico's RPS requirements and ensuring reliable service to EPE's customers. By including these Commission-approved BESS costs in base rates, EPE seeks recovery of the actual and reasonable costs incurred for these resources, consistent with regulatory approvals.

A. BUENA VISTA 1 BESS

Q17. WHAT IS EPE REQUESTING WITH RESPECT TO BV1 PPA CAPACITY CHARGES IN THIS RATE CASE?

A. EPE is seeking to include the annual capacity charges for the BV1 PPA in its proposed base rates. EPE's request aims to recover the actual costs incurred consistent with regulatory approvals and the Company's obligation to provide safe, reliable, and affordable service.

Q18. PLEASE DESCRIBE BV1 AND HOW IT IS USED IN NEW MEXICO.

A. The BV1 Facility provides 100 MWh solar energy and 50 MW battery storage to EPE's system under a 20-year PPA, jurisdictionally allocated between New Mexico and Texas.

BV1 began serving New Mexico customers in July 2023. As documented in EPE's latest REA Plan, the BV1 BESS provides firm, dispatchable capacity that enables EPE to shift renewable generation to periods of peak demand, enhance grid reliability, and maximize the use of clean energy resources for New Mexico service.

Q19. WHAT ARE THE ANNUAL CAPACITY CHARGES INCURRED UNDER THE BV 1 PPA THAT EPE IS REQUESTING TO INCLUDE IN BASE RATES?

A. Pursuant to the terms of the BV1 PPA, EPE incurs a charge of $5.46 per kW per month for the capacity provided by the BV 1 BESS. The total Company annual capacity charge incurred during the Base Period is $3,276,000 ($670,096 New Mexico jurisdictional). EPE has been incurring these BV1 capacity costs since the

resource became commercially operational in July 2023. EPE witness Reza addresses the recovery of these deferred costs, and EPE witness Hernandez addresses jurisdictional allocations.

Q20. ARE THE ANNUAL BV1 CAPACITY COSTS INCURRED CONSISTENT WITH THE APPROVALS GRANTED IN CASE NO. 19-00348-UT?

A. Yes, they are. The Commission approved BV1 PPA includes the fixed capacity payment of $5.46/kW-month over the twenty-year term of the contract. The BESS component of the BV1 PPA will provide reliable and economic capacity to EPE customers over the expected 20-year service life of the facility and will continue to support EPE's progress toward renewable energy goals set by the REA.

B. SANTA TERESA BESS

Q21. PLEASE PROVIDE AN OVERVIEW OF THE SANTA TERESA PROJECT.

A. The Santa Teresa Project is a large-scale renewable energy facility comprised of 150 MW of solar photovoltaic generation paired with 150 MW of BESS with an expected commercial operation date of June 30, 2026. The project is designed to provide firm, dispatchable renewable energy to meet EPE's growing customer demand and compliance with New Mexico's RPS. The battery storage component allows EPE to shift solar generation to peak hours, mitigate curtailment, and enhance grid reliability. The Santa Teresa Project will play a key role in EPE's

strategy to deliver clean, reliable, and affordable electricity to New Mexico customers.

Q22. WHAT PORTION OF THE SANTA TERESA PROJECT ESA IS APPROVED FOR USE IN NEW MEXICO?

A. Fifty MW of the 150 MW battery energy storage component of the Santa Teresa Project has been approved as an REA procurement for New Mexico. This is consistent with EPE's 2026 REA Plan and Commission orders, which recognize the need for additional renewable and storage resources in New Mexico.

Q23. WHAT TEST YEAR PERIOD SANTA TERESA PROJECT CAPACITY CHARGES IS EPE PROPOSING IN THIS CASE?

A. EPE is proposing to recover the annual capacity costs for the 50 MW portion of the 150 MW facility approved for New Mexico, which is $7.77 million. As addressed in the direct testimony of Julissa Reza, EPE seeks to adjust its Base Period costs to include the $7.77 million in annual capacity charges associated with the 50 MW STP BESS. EPE witness George Novela provides further support for this proposal, consistent with the Final Order in Case No. 25-00038-UT.

Q24. ARE THE ANNUAL STP CAPACITY COSTS KNOWN AND MEASURABLE, WILL THE PROJECT BE IN SERVICE WHEN RATES

TAKE EFFECT, AND ARE THE COSTS CONSISTENT WITH THE APPROVALS GRANTED IN CASE NO. 25-00038-UT?

A. Yes. Under the Commission approved Energy Storage Agreement with Santa Teresa Storage, LLC, the capacity charges for the Santa Teresa BESS are set at $12.95 per kW per month for the installed capacity allocated to New Mexico customers over the 20-year contract. The STP is planned to be in service in June 2026. Therefore, the STP annual capacity costs are known and measurable, and the facility will be in service within four months of filing EPE's rate application.

C. CARNE BATTERY STORAGE

Q25. PLEASE PROVIDE AN OVERVIEW OF THE CARNE PROJECT.

A. The Carne Project is a major renewable energy and storage initiative dedicated to serving EPE's New Mexico customers. Selected through EPE's 2021 New Mexico RFP, the Carne Project consists of a 130 MW solar photovoltaic facility paired with a 65 MW BESS. This project is specifically designed to help EPE meet New Mexico's increasing RPS requirements and to provide reliable, clean energy to the region.

The Carne Project is structured as a long-term power purchase and energy storage agreement, ensuring that both the solar and storage components are dedicated to New Mexico load. The BESS is engineered to provide four hours of firm, dispatchable capacity, allowing EPE to shift solar generation to periods of

peak demand, reduce curtailment, and enhance grid reliability. This operational flexibility is critical as EPE integrates higher levels of renewable energy and works to maintain system stability.

Q26. WHAT TEST YEAR PERIOD CARNE CAPACITY CHARGES IS EPE PROPOSING IN THIS CASE?

A. EPE is proposing to recover the annual capacity costs for the 65 MW BESS facility approved for New Mexico, which is $8,572,200. As addressed in the direct testimony of Julissa Reza, EPE seeks to adjust its Base Period costs to include the $8,572,200 in annual capacity charges associated with the Carne BESS. EPE witness Novela provides further support for this request.

Q27. ARE THE ANNUAL CARNE CAPACITY COSTS KNOWN AND MEASURABLE, WILL THE PROJECT BE IN SERVICE WHEN THE RATES TAKE EFFECT, AND ARE THE COSTS CONSISTENT WITH THE APPROVALS GRANTED IN CASE NO. 22-00093-UT?

A. Yes. The contract price for the Carne battery storage component is $10.99 per kW-month. This price is established in the executed energy storage agreement for the 65-MW battery portion of the Carne Project and is consistent with the approvals granted by the Commission in Case No. 22-00093-UT. The Carne BESS facility is

anticipated to be in service within two months of filing EPE's rate case application.[2] Therefore, the annual capacity costs are known and measurable and the resource will be in service when the rates take effect.

V. PALO VERDE GENERATION STATION

A. OVERVIEW

Q28. PLEASE SUMMARIZE EPE'S COST OF SERVICE AND RATE BASE ADDITIONS REQUESTS FOR PVGS.

A. EPE is requesting total Company rate base capital additions of $211,646,830 ($28,861,156 New Mexico jurisdictional) placed in service at PVGS from October 1, 2024 through September 30, 2025, adjusted for October 2025. The Company's requested capital additions include a credit adjustment of $172 thousand for October 2025, reflected in witness Prieto's Exhibit CSP-1. EPE is also requesting $110,473,512 in total Company Test Year Period non-fuel O&M, including Administrative and General ("A&G"), for PVGS ($16,551,656 New Mexico jurisdictional basis). These capital and O&M amounts are adjusted as addressed by EPE witnesses Cynthia S. Prieto, and Steven A. Sierra. I will discuss total Company capital investments and operating costs in my testimony. EPE witness Hernandez

[2] Additional Information on the Carne BESS facility status will be provided in EPE's Carne Project Quarterly Status Report for the quarter ending March 2026, to be filed on March 31, 2026 in Docket 22-00093-UT.

discusses the allocation of total Company costs to the New Mexico jurisdiction in his testimony.

Q29. HAVE PVGS UNIT 3 RELATED CAPITAL ADDITIONS BEEN REMOVED FROM NEW MEXICO?

A. Yes. EPE witness Hernandez's testimony discusses the removal of PVGS Unit 3 and one-third of common plant through the jurisdictional allocation process.

Q30. WHAT CONTROL DOES EPE HAVE OVER PVGS?

A. EPE is a minority owner of PVGS. While EPE still exercises reasonable oversight, it does not have the same comprehensive authority that it does over its local generating units.

Q31. IS PVGS A RELIABLE ECONOMIC RESOURCE FOR THE COMPANY'S CUSTOMERS?

A. Yes, it is. The plant is a critical asset to the Southwest, generating more than 32 million megawatt-hours of carbon-free electricity annually making it the 2nd largest clean-air energy producer in the country. PVGS has long been a source of power at low fuel prices for EPE's customers. PVGS contributes to a portfolio of generation resources that provides long-term security to customers through its fuel diversity.

Q32. WHAT STEPS HAVE EPE AND THE OTHER PARTICIPANTS TAKEN FOR THE CONTINUED AVAILABILITY OF THIS RESOURCE?

A. The U.S. Nuclear Regulatory Commission ("NRC") originally granted PVGS a 40-year operating license. The participants applied for an extension of the operating license. In April 2011, the NRC granted this request. As a result, the operating licenses for all three PVGS units have been extended 20 years beyond the original 40-year licenses, allowing Unit 1 to operate through June 1, 2045; Unit 2 through April 24, 2046; and Unit 3 through November 25, 2047.

Q33. WHAT IS THE OWNERSHIP STRUCTURE OF PVGS?

A. PVGS is owned by seven southwestern utilities ("Owners" or "Participants") with various ownership interests: Arizona Public Service Company ("APS") (29.10 percent), EPE (15.80 percent), the Salt River Project Agricultural Improvement and Power District (20.40 percent), Southern California Edison Company (15.80 percent), Public Service Company of New Mexico (7.29 percent), Southern California Public Power Authority (5.91 percent), and Los Angeles Department of Water and Power (5.70 percent).

Q34. HOW IS PVGS OPERATED?

A. APS is the operator of PVGS pursuant to a contract among the Owners, entitled the

Arizona Nuclear Power Project Participation Agreement ("PVGS-PA"), which became effective August 23, 1973, and has been amended sixteen times. The PVGS-PA calls for five Owner committees: Administrative Committee, Engineering & Operations ("E&O") Committee, Nuclear Fuel Task Force ("NFTF") Committee, Audit Committee, and Termination Funding Committee. I serve as a member of the Administrative, E&O, and NFTF Committees. Internal Audit, Plant Accounting, and System Operations department employees represent EPE on the other three committees.

Q35. PLEASE DESCRIBE PVGS.

A. PVGS is a nuclear generating station, located on an approximately 4,000-acre site approximately 50 miles west of Phoenix, Arizona. The facility consists of three separate, virtually identical generating units and a variety of common support facilities. The Design Electrical ratings of the facilities are 1,334 MW for Unit 1; 1,336 MW for Unit 2; and 1,334 MW for Unit 3. EPE's share of the total PVGS design capacity is 633 MW. PVGS also has a switchyard, operated by Salt River Project, which operates at 500 kV.

The major physical elements can be classified into two categories: (1) structures and buildings comprising each generation unit and (2) structures and buildings` comprising the common areas of the plant. Each unit consists of (1) the following structures: main steam support structure, three cooling towers, and two

essential spray ponds; and (2) the following buildings: containment, turbine, corridor, auxiliary, control, radwaste, emergency diesel generator, fuel, and operations support. The major common area plant consists of a three-building administrative complex, a three-building training facility, maintenance, and warehouse facilities, a low-level radwaste processing and storage facility, security and emergency response facilities, three evaporation ponds and the water resource facility, steam generator and reactor head storage facility, and a dry cask fuel storage facility.

B. PVGS CAPITAL REVIEW PROCEDURES

1. MONITORING AND APPROVAL PROCESS OF CAPITAL COSTS

Q36. HOW DOES EPE MONITOR PVGS CAPITAL ACTIVITIES AND COSTS?

A. EPE monitors PVGS capital activities and costs primarily through the E&O Committee's Capital Improvement Budget and Capital Project Approval process ("Capital Budget Procedure"). EPE participated in the original development of this procedure, which provides a process for all Owners to review, approve and control PVGS capital improvement costs. The PVGS Owners must unanimously approve all capital improvements. A unanimous vote is likewise required for the capital budget each year. Once the budget is approved, APS can proceed with construction only on those projects for which E&O Committee approval has been received.

Q37. WHAT IS EPE'S REVIEW PROCESS FOR THE PVGS CAPITAL BUDGET?

A. EPE reviews the annual PVGS Capital Budget as part of the overall budget package, to ensure that budget items and levels match the requirements determined necessary for safe and efficient operation by the E&O Committee. EPE analyzes the capital budget line items for consistency with activities from prior years and with ongoing repair, replacement, and improvement efforts. EPE regularly attends and participates in plant meetings to better understand and evaluate capital budget needs.

EPE reviews budget submittals to ensure that each project is properly classified and presented. Specifically, EPE verifies that projects are correctly identified as either capital or O&M expenditures, are assigned to the appropriate budget category, and that any carryover work from a prior budget year is accurately reflected.

EPE also reviews individual projects to confirm that projected total costs remain within the capital improvement work authorization variance limits established under the Capital Budget Procedure. In addition, EPE evaluates projected indirect capital improvement overhead and distributable costs and compares those amounts to historical experience. Finally, EPE reviews the economic justification supporting each capital project.

Q38. DOES BUDGET APPROVAL ALLOW APS TO PROCEED WITH CONSTRUCTION OF SPECIFIC PROJECTS?

A. No. Capital budget approval only indicates Owner concurrence to fund the capital project program at a certain level for a budget year. APS is not able to proceed with project implementation until each project has been reviewed and approved by PVGS staff, senior management, and the applicable Owner Committee(s). When the budget contains a previously approved project by the Owners, and that project is ongoing, then APS can continue with construction of that project based on prior approval by the Owners.

Q39. DOES EPE COMPARE ACTUAL PVGS CAPITAL COSTS TO BUDGET AMOUNTS?

A. Yes. EPE monitors variance explanations for budgeted amounts on a monthly basis. This monthly analysis allows comparison of individual projects against budget, and against the total amount approved for the individual project. EPE can further investigate any material variances and communicate with APS to address any concerns.

Q40. WHAT DO YOU CONCLUDE ABOUT THIS PROCESS FOR THE REVIEW AND APPROVAL OF CAPITAL EXPENDITURES?

A. The review and approval process vets projects through multiple layers of review to

confirm they are necessary and reasonable. Review and approval are required by PVGS management and unanimous approval is required by the Owners. The approval process ensures that capital improvements at PVGS are consistent with the needs of all the Owners and in the interest of their customers.

2. PVGS CAPITAL ADDITIONS TO RATE BASE

Q41. WHAT AMOUNT OF PVGS CAPITAL ADDITIONS IS INCLUDED IN THE TEST YEAR PERIOD?

A. The Company is including $211,646,830 in PVGS total Company capital additions to rate base since the 2020 Rate Case through the Base Period ending September 30, 2025, adjusted for October 2025 as reflected in witness Prieto's Exhibit CSP-1. EPE witness Prieto addresses the adjustments to these capital amounts. With the exclusion of PVGS Unit 3 and 1/3 common capital additions, as addressed by EPE witness Hernandez, the New Mexico jurisdictional amount of PVGS capital additions is $28,861,156.

3. MAJOR CAPITAL PROJECTS

Q42. WHAT CRITERIA HAVE YOU USED TO DISTINGUISH MAJOR INDIVIDUAL CAPITAL ADDITION PROJECTS FROM OTHER PROJECTS IN YOUR TESTIMONY?

A. The distinction was based on total cost amount. "Major Individual Capital

Additions" are projects with a total Company cost of $3.5 million or more that were placed in service from January 2020 through September 30, 2025, excluding PVGS Unit 3. These projects and costs are identified in Table VM-1 below. These project costs are stated as EPE's total Company share only and include PVGS Distributable and Overhead cost allocations.

TABLE VM-1

Work Order	Title	Description	Rate Base Addition Total Company	Category	Unit
200250	S.C.O.R.E Supply Chain Optimization	Replacement of legacy supply chain management system because the legacy system is no longer supported. The replacement supports ongoing changes and implantation of newer technology around supply chain, work management, and procurement	7,557,290	Information Technology	Common
180071	WRF Clarifier Life Extension (T6)	The WRF solids contact clarifier system structures have exceeded their design life expectancy. Refurbishment is necessary to extend the life of the clarifiers	4,432,759	Water Resource Facility	Water Reclamation
		Strategic Modernization Program replaces several			

Work Order	Title	Description	Rate Base Addition Total Company	Category	Unit
200015	Main Generator Stator Rewind	The expected life of the main generator stator windings is approximately 30 years; stator rewinds include extending the design life of the main generator stator winding and associated equipment and mitigating stator cooling water leaks.	3,888,841	Plant Equipment & Replacements	Unit 1
190056	WRF Clarifier Life Extension (T3)	The WRF solids contact clarifier system structures have exceeded their design life expectancy. Refurbishment is necessary to extend the life of the clarifiers	3,888,617	Water Resource Facility	Water Reclamation
240007	Digital SMP Phase II U2	Strategic Modernization Program replaces several plant control systems both analog and digital with newly designed upgrade equipment. Addresses obsolescence, removes single point vulnerabilities, and minimizes spare part inventories.	3,680,439	Unit 2	Plant Modifications
200041	WRF Clarifier Life Extension (T4)	The WRF solids contact clarifier system structures have exceeded their design life expectancy. Refurbishment is necessary to extend the life of the clarifiers	3,547,134	Water Resource Facility	Water Reclamation

The remaining $136.7 million, excluding PV Unit 3, generally fall into the following project categories:

- Plant Equipment and Replacements include tools used to perform maintenance and replacements of retired equipment: $68.0 million
- Plant Modifications are changes to the plant design, including simulator and process computers: $28.7 million,
- Water Resources includes all facility modifications, replacements, and process computers specific to the Water Resource Facility: $12.1 million,
- Information Technology is non-process computer hardware and software as well as licenses: $8.8 million,
- General Plant consists of communications-related equipment, rolling stock, land purchases, roads, and parking lots: $4.5 million,
- Buildings include initial construction and remodel of buildings and facilities: $6.3 million,
- Overheads in support of Capital Improvements and Distributables in support of Plant Modifications and Plant Replacements: $8.3 million, and
- Miscellaneous consists of all remaining projects not assigned to a category, which includes circuit breaker replacements, planning and oversight, and other small replacements: ($16 thousand).

Q43. WHAT OTHER CAPITAL ADDITIONS ARE INCLUDED IN THE TEST YEAR PERIOD FOR PVGS?

A. As indicated above, and on EPE witness Prieto exhibit CSP-1, EPE is including a credit of $172 thousand of total Company PVGS capital additions closed to plant in October 2025.

Q44. ARE THE PVGS CAPITAL EXPENDITURES INCLUDED IN EPE'S REQUEST REASONABLE AND NECESSARY?

A. Yes. PVGS is a critical asset to EPE as it is highly reliable, provides a significant amount of EPE's energy and capacity, and provides long-term security to customers through fuel diversity. Capital additions that maintain the plant are necessary. They support the long-term viability of the plant, satisfy regulatory requirements, improve safety, and support the people who work at the site. The capital projects represented by these costs have undergone a rigorous and thorough budget and project review process. EPE, as well as all other PVGS Owners, have concurred that the projects and related costs are reasonable and necessary for PVGS to safely and efficiently generate electricity for the long term.

VI. PVGS OPERATIONS AND MAINTENANCE EXPENSE

A. GENERAL DISCUSSION

Q45. DOES EPE MONITOR AND REVIEW PVGS O&M COSTS?

A. Yes. EPE reviews the annual O&M budget package, including budget assumptions and O&M budget. EPE reviews the package to ensure that the budget is reasonable based upon expected plant performance and the refueling and maintenance outage

schedules and is consistent with the budgeted staffing levels and needs (*e.g.*, loads, insurance premiums, and NRC fees). In addition to a total budget, APS provides separate refueling and maintenance outage budgets which EPE reviews to verify that the amounts and scope are both reasonable and consistent with planned outage dates. The views and questions submitted by other Owners on the proposed O&M budget are also reviewed and considered by EPE prior to EPE participating in the budget approval process. Unanimous approval of the Owners is required under the PVGS-PA.

Q46. HOW DO PVGS OPERATING COSTS COMPARE TO THE INDUSTRY?

A. Because PVGS is unique to the industry in supporting a Water Resource Facility ("WRF"), those costs have been removed in Figure VM-1 below to give an accurate comparison to the industry. The graph below shows the Electric Utility Cost Group data in comparison to the PVGS operating cost per MWh to the industry average. PVGS expenditures (excluding the WRF) and higher capacity factors has operating costs per MWh that were within the industry average. In Figure VM-1 there is an increase that is visible over the 2022-2024 time period. This increase is reflective of changes that were made particularly in staffing and compensation in order to ensure the attraction and retention of quality personnel. These personnel were essential to arrest a trend of declining plant performance that had been seen in the years prior to the change.

FIGURE VM-1

	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
PV O&M (w/Incentives) $/MWh	$18.04	$18.18	$18.34	$18.51	$17.91	$17.32	$16.18	$16.01	$17.51	$20.02
Industry O&M $/MWh	$20.85	$20.43	$20.51	$19.76	$18.55	$18.27	$18.07	$18.68	$19.38	$19.55

EUCG Data – all costs in nominal dollars. Costs include WRF.
Industry Data Source is copyrighted by EUCG, Inc.

B. TEST YEAR PERIOD COSTS

Q47. WHAT IS THE PVGS O&M EXPENSE INCLUDED IN THE TEST YEAR PERIOD?

A. EPE included $110.5 million of total Company Palo Verde Test Year Period non-fuel O&M expenses, including A&G costs, ($16.6 million New Mexico jurisdictional basis). The total Company PVGS O&M cost information is included in Schedule H-1 sponsored by EPE witness Sierra.

Q48. WHAT DOES THIS AMOUNT REPRESENT?

A. This amount represents EPE's Test Year Period total Company share of the costs to

perform the day-to-day operational activities and maintenance tasks on Units 1, 2, 3, Water Resource Facility, and common plant at PVGS that were included in the approved PVGS budget. EPE witness Hernandez's testimony discusses the exclusion of O&M costs for PVGS Unit 3 and one third of common plants through the jurisdictional allocation process.

Q49. PLEASE DESCRIBE THE WATER RESOURCE FACILITY AT PVGS AND ITS ROLE IN PLANT OPERATIONS.

A. The WRF is an integral support facility that enables PVGS to operate safely and reliably by providing a continuous supply of cooling water for plant operations. The WRF receives treated effluent water from municipal wastewater treatment facilities, processes that water to meet plant quality requirements, and stores it on site for use in Palo Verde's cooling systems.

The facility is responsible for treating, managing, and delivering water used in the station's cooling towers, which are essential to the operation of all three generating units. This process includes removing minerals and other constituents that could damage equipment, storing treated water in on-site reservoirs, and ensuring sufficient availability to support continuous plant operation under varying operating conditions.

The WRF is operated and maintained as part of PVGS overall infrastructure and represents a necessary and ongoing component of plant operations. Its

operation allows PVGS to continue providing reliable, carbon-free baseload energy to customers, and the associated costs are a necessary and unavoidable part of operating the facility.

Q50. DOES THE WATER RESOURCES FACILITY IMPACT THE YEARLY SPEND AT PALO VERDE?

A. Yes, as already discussed, Palo Verde is the only nuclear power plant in the world that has its own water resources facility. Operation of the WRF represents approximately $11.9 million in the Test Year Period for PVGS total Company that are not incurred by other nuclear power plants. The Water Resources Facility O&M level corresponds to approximately 10.2% of Palo Verde's total operating cost.

Q51. HAVE THERE BEEN CHANGES TO THE INCENTIVE STRUCTURE UTILIZED BY PALO VERDE?

A. Yes. Palo Verde’s incentive structure has undergone changes over the past several years to ensure alignment with operational priorities and evolving industry standards. Metrics have been strategically added, removed, or modified each year to reinforce behaviors that promote safety, reliability, efficiency, and regulatory compliance. For example, between 2020 and 2025, changes included replacing OSHA Recordables with Serious Injuries or Fatalities, introducing and later removing metrics such as Voluntary Protection Permit, INPO Operational Focus

Index, and Equipment Performance Index, as well as adjustments to financial and performance indicators like Capital Budget and Scrams. EPE is not seeking any financially based incentive compensation in this proceeding. Refer to the direct testimony of EPE witness Sierra. These refinements reflect senior leadership's commitment to maintaining focus on the most impactful areas of performance.

Q52. WHAT PROGRAM OR PROCESS IS IN PLACE TO ADDRESS OVERSIGHT AND MANAGEMENT OF O&M EXPENDITURES AT PVGS?

A. From an Owner oversight perspective, the PVGS O&M budget is developed by the operator, APS, and submitted annually to the Owners for review and approval. The budget package includes key assumptions related to plant staffing, refueling and maintenance outage duration, and planned work scope, which are reviewed by the Owners through established committee processes.

As a non-operating Owner, EPE participates in the review and approval of the PVGS O&M budget through the E&O Committee and the Administrative Committee, both of which require unanimous Owner approval. During the year, APS provides regular budget status updates, variance explanations, and cost reports to the Owners, including monthly Executive Cost Reports and updates at E&O Committee meetings. This process allows the Owners, including EPE, to monitor PVGS O&M expenditures, ask questions, and seek clarification regarding budget

performance, cost drivers, and variances, while day-to-day management and execution of O&M activities remain the responsibility of APS as the operating agent.

Q53. PLEASE DESCRIBE PVGS COST CONTROL EFFORTS?

A. Based on information provided to the Owners by APS, PVGS has undertaken initiatives in recent years aimed at improving equipment reliability and supporting strong summer performance. These initiatives have included targeted capital investments, work process improvements, and efforts to enhance long-term workforce sustainability.

From the Owner perspective, EPE has observed that these efforts have been accompanied by higher O&M expenditures, reflecting increased focus on reliability, staffing, and plant performance. At the same time, Owner oversight reports indicate improvements in outage duration, equipment reliability, and capacity factor, which are key performance metrics monitored by the Owners.

EPE evaluates PVGS cost control efforts through its participation in Owner committees by reviewing budget performance, variance explanations, and comparative industry data, including operating cost per megawatt-hour. This oversight allows EPE to assess whether PVGS O&M expenditures remain reasonable and aligned with the goal of delivering safe, reliable, and efficient service to customers, while operational decisions and cost execution remain the

responsibility of APS.

Q54. ARE THE TEST YEAR PERIOD EXPENDITURES REASONABLE?

A. Yes. These costs are reasonable and representative of the Test Year Period. Proposed budgets are closely scrutinized before an O&M budget is adopted. Palo Verde continues to take a strategic view of costs and invest in the plant and people to maintain excellent material condition of the station and knowledge and performance of the people who run it.

Q55. HOW DOES EPE DETERMINE IF O&M COSTS ARE REASONABLE?

A. As described previously, EPE participates in the review and approval of the reasonableness of the PVGS O&M budget. EPE monitors the PVGS O&M variance explanations and identifies issues throughout the year. EPE makes informal and formal recommendations for corrective action as is necessary. Furthermore, EPE monitors operational issues affecting plant capacity factor enhancements, maintenance efficiencies, and compares costs to industry averages. These steps help to ensure that costs remain reasonable not only when looking at operational budgets but also when costs are measured on a cents-per-MWh basis. PVGS is a valuable asset to EPE and produces large quantities of safe, clean, reliable, and efficient power for its customers.

Q56. DOES APS PROVIDE EXPLANATIONS OF ANY PVGS O&M BUDGET VARIANCES?

A. Yes. APS and PVGS personnel provide monthly variance reports and explain variances at E&O Committee meetings. Where necessary, EPE and other Owners seek clarifications in order to make recommendations.

C. TEST YEAR PERIOD ADJUSTMENTS

Q57. DID EPE MAKE ANY TEST YEAR PERIOD ADJUSTMENTS FOR NON-FUEL O&M AND RATE BASE COSTS FOR PVGS AND DO YOU PROVIDE SUPPORT FOR ANY OF THE ADJUSTMENTS?

A. Yes, EPE witnesses Sierra and Reza address adjustments to non-fuel O&M and rate base costs for Palo Verde. I provide support for the adjustment to rate base to recognize the unamortized amount related to the Effluent Agreement that secures a reliable source of cooling water through 2050 for Palo Verde. I also provide additional support for the PVGS incentive compensation adjustment discussed by witness Sierra.

Q58. WHAT IS THE PURPOSE OF THE PVGS EFFLUENT AGREEMENTS.

A. Palo Verde is unique as the only nuclear power plant in the world that it is not located on or near a large body of water. While most other nuclear facilities rely on oceans, lakes or rivers for cooling, Palo Verde must obtain water from other sources

and must discharge any wastewater to a system that will not adversely impact surface or underground water supplies. Obtaining cooling water for Palo Verde is a unique and necessary cost of doing business that is not incurred at any other nuclear power plant in the world. The cost of water and maintaining the WRF added approximately $2.63/MWh to O&M costs during the Base Period.

Instead of drawing from surface water sources, Palo Verde obtains treated effluent cooling water from two wastewater treatment plants ("WWTP") in the greater Phoenix area—one operated by the Sub Regional Operating Group (SROG), which includes Glendale, Mesa, Phoenix, Scottsdale, and Tempe, and the other in Tolleson. The long-term effluent agreements with these facilities ensure a reliable supply of cooling water for PVGS through 2050.

Q59. WHAT DOES THE UNAMORTIZED AMOUNT OF $2.1 MILLION FOR THE EFFLUENT AGREEMENT REPRESENT?

A. The PVGS Effluent Agreement required a lump-sum payment of $30 million dollars in addition to a per acre-foot price from Palo Verde participants. The $2.1 million represents EPE's portion, excluding PVGS Unit 3 and 1/3 common, of the unamortized lump-sum payment, which is to be amortized through the term of the agreement.

Q60. HAS THE EFFLUENT AGREEMENT BENEFITED EPE CUSTOMERS?

A. Yes. The effluent agreement directly benefits EPE customers by ensuring a continued, reliable supply of cooling water for operation of PVGS Obtaining water is an operational necessity because PVGS is not located near a natural water source. Additionally, by using treated effluent for cooling rather than fresh water, the plant conserves groundwater sources.

The effluent agreement secures a reliable water supply for PVGS through 2050, thereby supporting the long-term availability of PVGS as a baseload, carbon-free resource that provides stable and low fuel-cost energy to EPE customers. The required prepayment structure mitigates supply and cost risk over the term of the agreement and avoids potential exposure to water scarcity, market volatility, or operational interruptions that could otherwise result in higher costs or reduced reliability.

Accordingly, the costs of the effluent agreement, including the required prepayment, are reasonable and necessary costs of operating PVGS and directly support continued reliable service and long-term value for EPE customers.

D. PVGS PERFORMANCE DURING THE BASE PERIOD

Q61. DID PVGS OPERATE EFFICIENTLY DURING THE BASE PERIOD?

A. Yes, it did. During the peak period of June 15 through September 15, 2025, Palo Verde achieved a 100.06% capacity factor and produced approximately 31.8 million MWh. In 2022, PVGS achieved a capacity factor of 92.59 percent. In

2023, the capacity factor was 91.42 percent and in 2024 the capacity factor was 93.65%. For comparison, the US Nuclear Newswire estimate reported the United States nuclear fleet averaged a 90.86 percent for years 2022-2024. PVGS continues to work to improve performance at the plant and will continue to incur costs related to its efforts to achieve excellent performance.

Q62. PLEASE SUMMARIZE YOUR TESTIMONY REGARDING THE REASONABLENESS OF PVGS COSTS.

A. Palo Verde Generating Station operated consistently with its fuel specific generation counterparts. The approach to spending is deliberate and informed in order to deliver safe, reliable, and efficient service to customers at reasonable costs. Procedures and processes are in place to review and approve Capital and O&M expenditures. Both O&M and Capital expenditures were necessary and reasonable for the operation of EPE's remote asset.

VII. OTHER ISSUES

A. EMS

Q63. WHAT IS THE PURPOSE OF THIS SECTION?

A. The purpose of this section is to describe the recent upgrade of EPE’s Energy Management System ("EMS"). For context, this section begins with a high-level overview of EPE’s participation in the EIM, including the benefits and operational

impacts for New Mexico customers, and the investments made to enable participation. I then specifically address the EMS upgrade. This section demonstrates how EPE is leveraging advanced market participation and technology to deliver reliable, cost-effective, and clean energy to its customers.

Q64. CAN YOU PLEASE PROVIDE A HIGH-LEVEL EXPLANATION OF EIM AND ITS BENEFITS TO CUSTOMERS?

A. The EIM is a real-time wholesale electricity market operated by the California Independent System Operator. The EIM allows utilities across the western United States to buy and sell electricity every five minutes, enabling more efficient balancing of electricity supply and demand across a broad geographic footprint. Participation in the EIM allows EPE to access a larger regional market and enhances operational flexibility by enabling real-time coordination of generation resources.

Q65. WHAT ARE THE PRIMARY BENEFITS OF EPE'S PARTICIPATION IN THE EIM FOR NEW MEXICO CUSTOMERS?

A. EPE's participation in the EIM brings substantial benefits to New Mexico customers, most notably through cost savings. By leveraging real-time market transactions, EPE can purchase lower-cost energy during periods of surplus and sell excess generation when market prices are favorable. This dynamic approach

resulted in approximately $15.2 million in total benefits during the Base Period, with approximately $2.3 million of those benefits allocated to New Mexico customers, as detailed in Exhibit VM-01.

Beyond direct cost savings, the EIM enables EPE to more effectively integrate variable renewable resources such as solar and wind. Access to a broader regional market allows EPE to better manage fluctuations in renewable output and customer demand, supporting New Mexico's clean energy objectives and enhancing the value of renewable investments.

Participation in the EIM also improves grid reliability. Real-time coordination with other utilities across the EIM footprint strengthens EPE's ability to respond to system contingencies and manage unexpected outages. In addition, EIM participation allows EPE to optimize dispatch of its generation fleet, including battery storage and renewable resources, improving overall system efficiency while maintaining safe and reliable service.

Q66. HOW ARE THE BENEFITS OF EIM PARTICIPATION ALLOCATED TO NEW MEXICO CUSTOMERS?

A. All benefits derived from EPE's participation in the EIM, including cost savings and market revenues, are passed directly to customers through the fuel and purchased power cost adjustment mechanisms. Allocation to New Mexico customers is based on jurisdictional load and Commission-approved cost allocation

principles. During the Base Period, New Mexico customers received approximately $2.3 million in EIM-related benefits.

Q67. CAN YOU PLEASE DESCRIBE THE ENERGY MANAGEMENT SYSTEM UPGRADE?

A. EPE completed a comprehensive upgrade of its EMS, which serves as the central platform for monitoring, controlling, and optimizing the Company's electric system in near real time. The EMS upgrade was required to support full, efficient, and compliant participation in the EIM, integrate emerging resources, and meet the advanced technical requirements associated with battery energy storage, renewable resource integration, and real-time data exchange.

While EPE began participating in the EIM in April 2023 using existing systems and interim processes, the EMS upgrade was necessary to support expanded market participation, integration of battery storage and renewable resources, and compliance with evolving real-time operational and data requirements as EPE's system and market participation matured.

The upgraded EMS provides the analytical and control capabilities needed to operate safely and reliably in a real-time market environment, maintain compliance with applicable market protocols, and continue providing reliable electric service to customers. The costs associated with the EMS upgrade are included in EPE's proposed rate base and are supported by the operational

efficiencies, reliability improvements, and customer benefits achieved through the upgraded system.

Q68. WHAT IS THE COST OF THE EMS UPGRADE?

A. The total Company cost of the EMS upgrade project was approximately $8.1 million ($1.7 million on a New Mexico jurisdictional basis). This investment was necessary to ensure EPE's system could meet the technical requirements of the EIM and continue to provide reliable service to customers.

Q69. WHEN WAS THE EMS UPGRADE PLACED IN SERVICE?

A. The EMS upgrade was completed and placed into service for EPE customers in September 2024.

Q70. HOW IS THE EMS USED IN THE PROVISION OF ELECTRIC SERVICE TO EPE'S CUSTOMERS?

A. The EMS is essential to the reliable operation of EPE's power grid and its coordination within the Western Interconnection. The EMS centrally monitors, analyzes, simulates, optimizes, and controls EPE's generation, transmission, and distribution assets. It supports coordination of electricity flows with neighboring utilities and performs critical control functions, including economic dispatch and automatic generation control, while interfacing with system protection devices.

The EMS includes supervisory control and data acquisition functions such as data acquisition and processing, inter-control center communications, supervisory control, real-time calculations, tagging, alarming, and load shed and restoration. Network application functions include network topology processing, state estimation, dispatcher power flow, contingency analysis, and dispatcher training simulation. In addition, EPE utilizes custom applications for interchange scheduling, energy accounting, alarm processing, rotational load shedding, and transfer capability analysis, all of which are necessary for reliable system operation.

Q71. WERE THE COSTS OF THE EMS UPGRADE NECESSARY AND REASONABLE?

A. Yes. The EMS upgrade was necessary to communicate vital bulk electric system information in real time and to fully support EPE's participation in the EIM. The upgrade included new applications that support monitoring and control of renewable and battery storage resources, improved energy accounting capabilities, revenue-quality meter integration, network and cybersecurity upgrades, hardware refreshes, and extensions of end-of-life support windows. The costs associated with the EMS upgrade were reasonable and necessary to ensure continued safe, reliable, and efficient system operations.

B. NEWMAN UNIT 3 EXTENSION ANALYSIS

Q72. PLEASE DESCRIBE NEWMAN UNIT 3.

A. Newman Unit 3 is a conventional steam turbine generating unit owned and operated by EPE and located at the Newman Power Plant. The unit has a nameplate capacity of approximately 90 MW, and it serves as a dispatchable thermal resource that supports system reliability and operational flexibility.

The unit consists of a single steam turbine and generator supplied through a traditional boiler-steam cycle configuration. During normal operations, the unit provides both energy and ancillary services, including participation in Automatic Generation Control ("AGC") when available, as reflected in system operations and market communications.

Q73. FOR CONTEXT, CAN YOU BRIEFLY DESCRIBE THE NEWMAN UNIT 3 OUTAGE EVENT AND RELATED UPGRADE WORK?

A. Yes. In June 2023, Newman Unit 3 experienced an outage that ultimately resulted in the unit being out of service for an extended period. The outage consisted of a forced outage that occurred prior to a planned outage that had already been scheduled to begin later in 2023. During this extended outage period, work was performed on Newman Unit 3 that addressed the immediate repairs associated with the forced outage and incorporated additional work that would have otherwise been addressed during the planned outage.

The details of the outage, the specific repairs performed, and the circumstances surrounding the timing and prudence of the work are discussed and supported in the direct testimony of EPE witness Hughes. As a result of the work performed during this outage period, the useful lives of the Newman Unit 3 turbine and generator were effectively extended by approximately five years.

Q74. ARE YOU PROVIDING ADDITIONAL SUPPORT FOR THE NEWMAN 3 UPGRADES?

A. Yes. Energy Resources performed an analysis to determine the capacity deferment value of extending the service life of this 90 MW unit for an additional five years.

Q75. HOW WAS THAT ANALYSIS PERFORMED AND WHAT WERE THE RESULTS?

A. To establish a $/kW proxy price for building a new generation resource, Energy Resources used the levelized cost of energy spreadsheet for Newman Unit 6. Energy Resources then analyzed the cost of Newman Unit 3 upgrades against that proxy price. The analysis determined that the financial benefit that EPE will realize given the upgrades to Newman Unit 3 that were made during the 2023-24 outage, would be approximately $10.6 million of deferred capital costs by extending the service life of the unit for an additional five years, as opposed to building a new generation resource.

VIII. CONCLUSION

Q76. ARE THE CAPITAL INVESTMENTS THAT EPE IS REQUESTING TO INCLUDE IN RATE BASE FOR GENERATION PLANT ASSETS AND THE EMS REASONABLE?

A. Yes. The capital investments EPE seeks to include in rate base are reasonable, necessary, and directly related to the provision of safe, reliable, and cost-effective electric service to customers.

With respect to PVGS, the requested capital additions reflect prudent investments in equipment replacements, plant modifications, and infrastructure needed to maintain long-term operability, regulatory compliance, and reliability. These capital projects were developed through established planning processes and subjected to multiple layers of review and unanimous approval by the PVGS Owner committees. The investments preserve the long-term viability of a critical, carbon-free baseload resource that continues to deliver substantial value to EPE's customers.

The requested rate base addition associated with the unamortized portion of the PVGS effluent agreement likewise supports customer benefits by ensuring a reliable, long-term supply of cooling water needed for PVGS operations through 2050. These costs are a necessary and unavoidable aspect of operating this essential

generating resource and directly support continued reliable service at stable, low fuel costs.

In addition, the EMS upgrade represents a prudent and necessary modernization of EPE's grid management capabilities. The upgraded EMS supports expanded and compliant participation in regional energy markets, enables the integration of battery storage and renewable resources, enhances real-time monitoring and control, and improves overall system reliability and operational efficiency. The EMS upgrade provides foundational capabilities required to manage an increasingly complex resource mix and deliver cost-effective service to customers.

Q77. ARE THE O&M EXPENSES EPE PROPOSES TO RECOVER FOR PVGS REASONABLE?

A. Yes. The PVGS O&M expenses included in this case are reasonable, necessary, and representative of the Test Year Period. These expenses reflect EPE's share of costs required to safely operate and maintain a large nuclear generating facility, including routine maintenance, refueling outages, regulatory compliance, and workforce support.

PVGS O&M costs are developed through an annual budgeting process and are subject to rigorous review, monitoring, and approval by PVGS management and Owner committees. The resulting expenditures support strong plant

performance, as evidenced by PVGS capacity factors that meet or exceed industry averages, while ensuring adherence to stringent nuclear safety and regulatory standards.

Q78. ARE THE BV1 BESS, SANTA TERESA BESS AND CARNE BESS CAPACITY COSTS JUST AND REASONABLE TO INCLUDE IN BASE RATES AT THIS TIME?

A. Yes. These capacity costs arise from Commission-approved agreements and reflect resources that are or will be used and useful in serving New Mexico customers at the time new rates proposed in this filing take effect. Including these costs in base rates is consistent with cost-of-service principles and appropriately reflects the long-term nature of the resource. The BESS facilities provide firm capacity, operational flexibility, and support New Mexico's clean energy objectives while maintaining system reliability.

Q79. IS LOCAL GENERATION STILL USED AND USEFUL AND NECESSARY TO PROVIDE SERVICE TO EPE'S NEW MEXICO CUSTOMERS?

A. Yes. Local dispatchable generation continues to be an essential component of EPE's resource portfolio. Even as renewable energy and battery storage resources expand, gas-fired generation remains necessary to provide reliability, respond to system contingencies, and serve load during periods when renewable output is

limited or unavailable. EPE's IRP and load analyses demonstrate that a balanced portfolio of renewables, storage, and dispatchable generation is required to ensure reliable and affordable service.

Q80. DOES THIS CONCLUDE YOUR TESTIMONY?

A. Yes, it does.

EL PASO ELECTRIC COMPANY
TEST YEAR (TY) EIM BENEFITS SUMMARY
OCTOBER 24 - SEPTEMBER 25

Positive is payment to EPE / Negative is cost to EPE

Month	Report	Main Settlements	Admin	Penalty	Sub-Allocation	Counter Factual	EIM Dispatch	Net Benefits as Reported by CAISO
Oct-24	T+11M	$ 2,371,069	$ (25,537)	$ 9,180	$ (3,022)	$ (63,227)	$ (536,591)	**$ 1,751,871**

Exhibit VM-2

Load Curves Demonstrating the Need for Local Dispatchable Generation

Witness: Victor Martinez

On Behalf of: El Paso Electric Company

Proceeding: New Mexico Public Regulation Commission Case No. 25-00082-UT

Date: February 2026

This Exhibit presents El Paso Electric Company load curves used to illustrate system peak conditions, net-peak timing, and the continued need for local dispatchable generation to provide reliable electric service to El Paso Electric Company's New Mexico customers.

Figure VM-2.1 – Top 100 Peak Hours (2024)

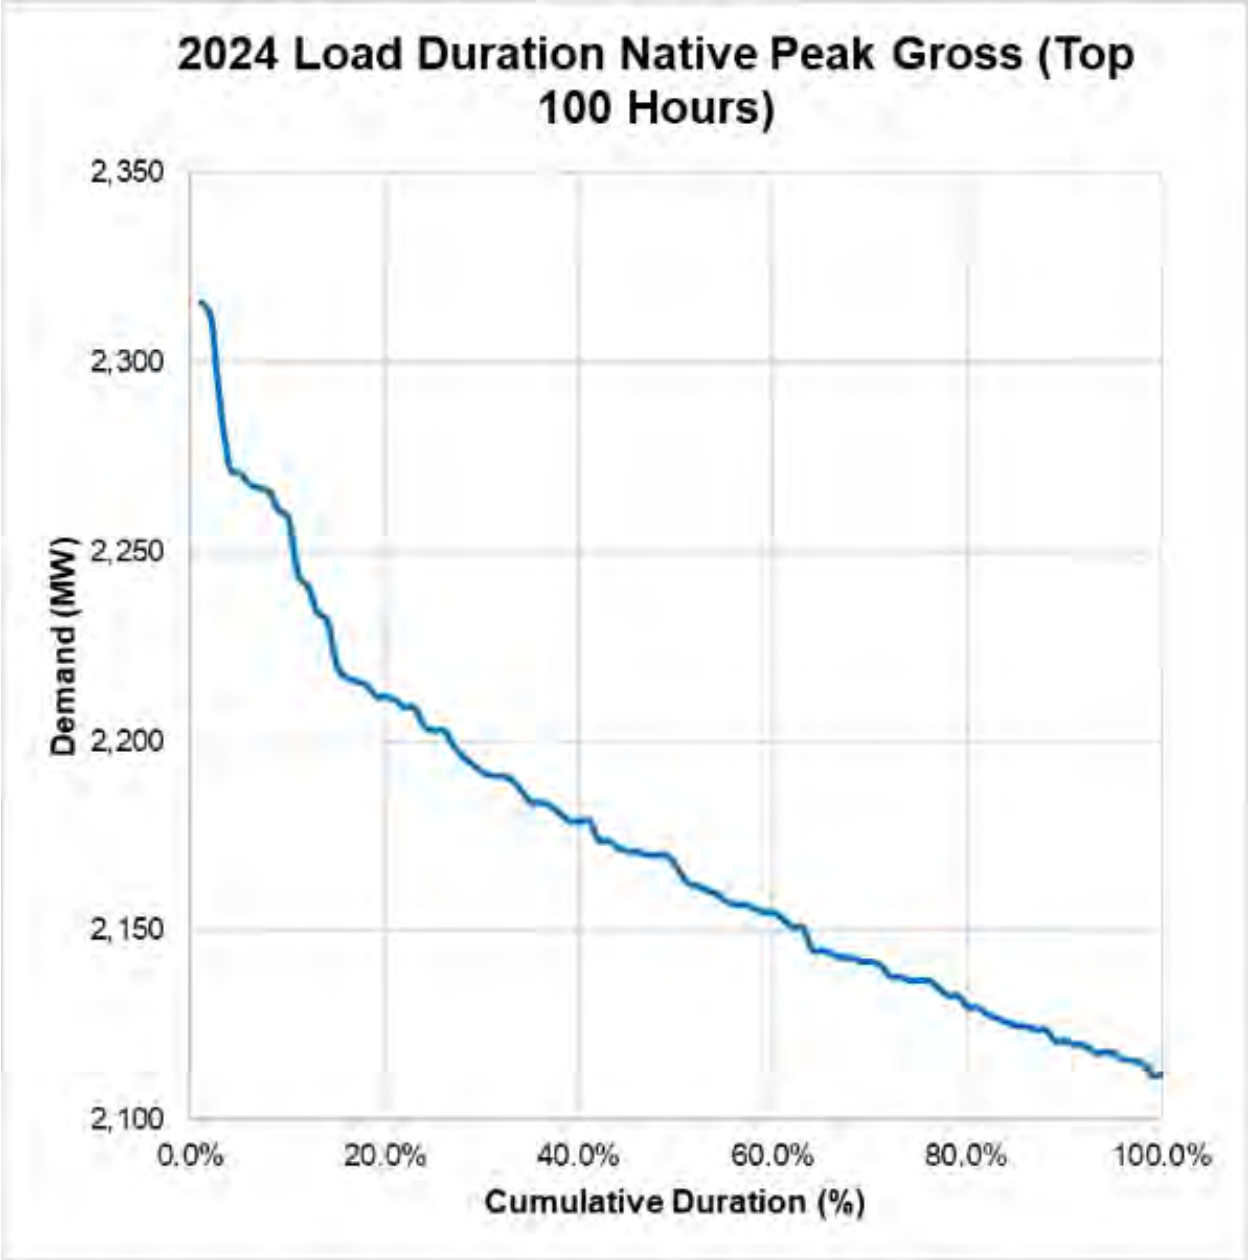

Figure VM-2.1 shows El Paso Electric Company's load duration curve for the Top 100 Native Peak Gross system load hours in calendar year 2024. The figure demonstrates that the highest system load conditions occur repeatedly during summer afternoon and evening hours rather than as isolated single-hour events.

Figure VM-2.2 – Typical Summer Day System Load Profile

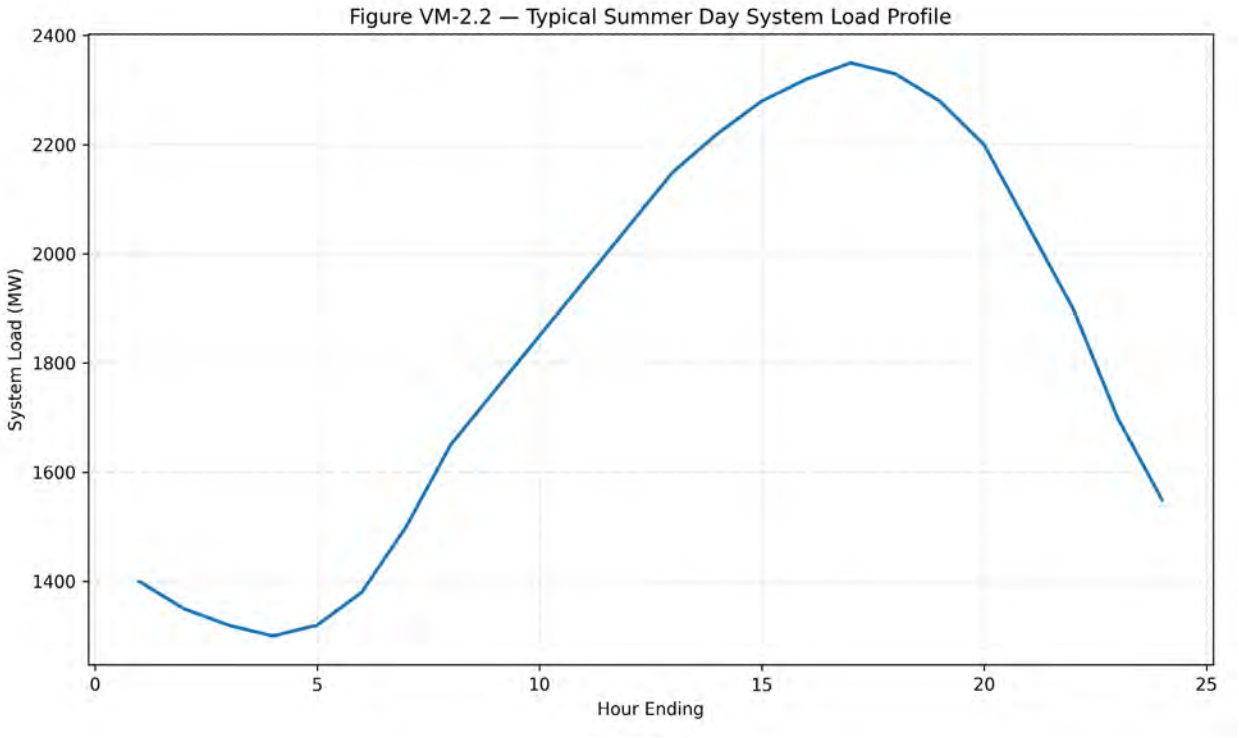

Figure VM-2.2 presents a representative average summer weekday system load profile for El Paso Electric Company from June – August 2024. The figure illustrates that system demand increases throughout the day and reaches its highest levels during the late afternoon and early evening hours.

Figure VM-2.3 – Net Load (Duck Curve) Illustration

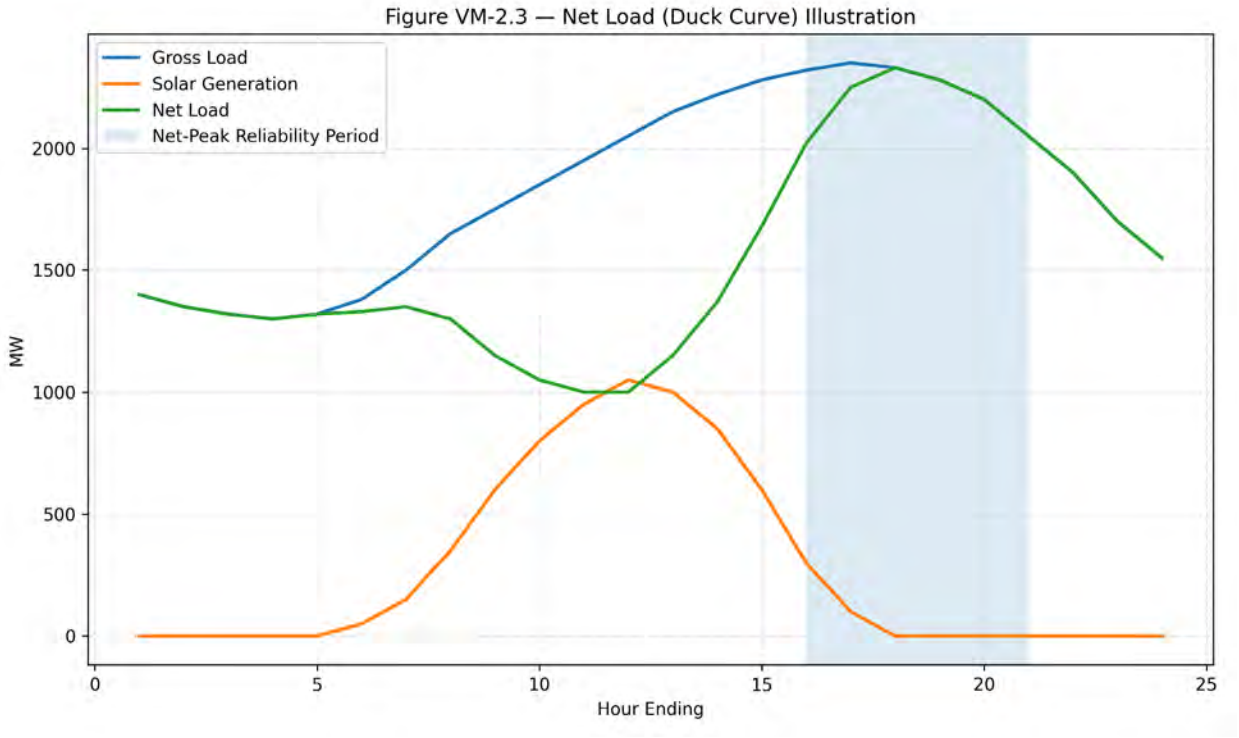

Figure VM-2.3 illustrates EPE's net load after accounting for representative solar generation from June – August 2024. The figure shows that system load remains elevated during evening hours when solar generation output is declining or unavailable, creating a net-peak reliability period that requires firm, dispatchable resources to maintain reliable service.

BEFORE THE NEW MEXICO PUBLIC REGULATION COMMISSION

IN THE MATTER OF THE APPLICATION OF EL PASO ELECTRIC COMPANY FOR REVISION OF ITS RETAIL ELECTRIC RATES PURSUANT TO ADVICE NOTICE NO. 317	)	**Case No. 25-00082-UT**
EL PASO ELECTRIC COMPANY, Applicant.	)	

DECLARATION OF VICTOR MARTINEZ IN SUPPORT OF THE FOREGOING DIRECT TESTIMONY TO THE APPLICATION OF EL PASO ELECTRIC COMPANY FOR REVISION OF ITS RETAIL ELECTRIC RATES PURSUANT TO ADVICE NOTICE NO. 317

I, ***Victor Martinez***, pursuant to Rule 1-011 NMRA, state as follows:

1. I affirm in writing under penalty of perjury under the laws of the State of New Mexico that the following statements are true and correct.

2. I am over 18 years of age and have personal knowledge of the facts stated herein. I am employed by El Paso Electric Company ("EPE" or "the Company") as the *Director – Energy Resources.*

3. The foregoing Direct Testimony of Victor Martinez, together with all exhibits sponsored therein and attached thereto, is true and accurate based on my knowledge and belief.

4. I submit this Declaration, based upon my personal knowledge and upon information and belief, in support of EPE's ***Application for Revision of Its Retail Electric Rates Pursuant to Advice Notice No. 317.***

FURTHER, DECLARANT SAYETH NAUGHT.

I declare under penalty of perjury that the foregoing is true and correct.

Executed on March 27, 2026.

/s/ Victor Martinez

EL PASO ELECTRIC COMPANY
DIRECT TESTIMONY OF
JEFFERY M. HUGHES

I. INTRODUCTION AND QUALIFICATIONS

Q1. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Jeffery M. Hughes. My business address is 4900 Stan Roberts Avenue, El Paso, Texas 79934 and 3501 Doniphan Drive, Sunland Park, NM 88063.

Q2. HOW ARE YOU EMPLOYED?

A. I am employed by El Paso Electric Company ("EPE" or the "Company") as Newman Power Plant Manager.

Q3. PLEASE SUMMARIZE YOUR EDUCATIONAL AND BUSINESS BACKGROUND.

A. I graduated from Albuquerque Technical Vocational Institute with a Certificate degree in Electronics Technology in 1995. Upon graduation I was employed by NovaBus Incorporated in Roswell, New Mexico, as an Electronic Technician in the Maintenance Department. My role was to troubleshoot, maintain, and update automated plant equipment at the company's bus manufacturing facility.

In 2001 I was hired by Rea Magnet Wire in Las Cruces, New Mexico, as an Electronic Technician-Maintenance. In April of 2005 I was promoted to Process Engineering Supervisor responsible for developing and controlling manufacturing processes, internal and external audits, and overall plant performance at the wire manufacturing facility.

In October 2008, I accepted a position at the Sapphire Energy Incorporated Research and Development site in Las Cruces, New Mexico, as Facilities & Maintenance Manager. My responsibilities were to oversee capital projects at the site and the development of equipment used to grow and harvest algae for oil extraction, as well as the site maintenance department.

I was hired by EPE in August 2015 as an Instrumentation and Control Supervisor at the Rio Grande Power Station. In March 2020 I was promoted to Interim Maintenance Superintendent, which became permanent in August 2020. In this role I was responsible for plant maintenance, budgets, and equipment reliability. In August 2021, I was promoted to Manager - Power Plant of the Rio Grande Power Station while also absorbing the role of Maintenance Superintendent. I was laterally transferred to the Newman Power Station as Plant Manager in December 2021. In January 2023, I accepted responsibility as Plant Manager of Newman and Rio Grande Power Stations for the operation, maintenance, and overall performance and budgets of both stations. I am currently Plant Manager of the Newman Power Station overseeing Operations, Maintenance, Engineering and Outage Management teams.

Q4. PLEASE DESCRIBE YOUR PRINCIPAL AREAS OF RESPONSIBILITY.

A. I oversee operations at the Newman Power Station, ensuring that the facility operates efficiently, safely, and in full compliance with environmental and

regulatory requirements, and I provide leadership for the operations of EPE's local generation. I have six years' experience at the Rio Grande Power Station as an Instrumentation and Control Supervisor, Maintenance Superintendent, and Plant Manager. The Rio Grande Station includes the first GE LMS100 gas turbine commissioned in the El Paso Electric fleet. The Montana Power Station consists of four GE LMS100 units commissioned after the Rio Grande Station LMS100. Additionally, I manage both preventative and corrective maintenance schedules to minimize downtime. My responsibilities also include budget and resource management, including operational budget control, procurement of materials, and optimal allocation of resources. On a daily basis, I coordinate with engineering teams to troubleshoot equipment issues and implement process improvements designed to boost plant performance. I supervise and mentor staff, facilitating training sessions on safety protocols and new technologies. I also collaborate with external contractors during major repairs or upgrades, and maintain inspections, maintenance activities, and support regulatory reporting. My role demands continuous assessment of emerging industry standards, allowing me to introduce innovations that improve reliability and sustainability at the power plant.

Q5. HAVE YOU PREVIOUSLY PRESENTED TESTIMONY BEFORE UTILITY REGULATORY BODIES?

A. Yes. I have previously presented testimony before the Public Utility

Commission of Texas.

II. PURPOSE OF TESTIMONY

Q6. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. The purpose of my testimony is to support the necessary and reasonable costs of EPE's local generation needed to provide safe and reliable service to EPE's customers. First, I provide an overview of EPE's system, including EPE's service territory and its generating facilities. Next, I discuss the operational practices and performance metrics that guide the management of our generation assets including both ongoing operations and recent capital improvements since EPE's last rate case in NMPRC Case No. 20-00104-UT ("2020 Rate Case") through the end of September 30, 2025, Base Period, adjusted for local generation capital additions placed in service in October, 2025.

My testimony additionally addresses the reasonableness of the operations and maintenance ("O&M") expenses related to EPE's local generation together with the level of reasonable and necessary O&M expenses for EPE's local generation that should be included in rates.

Please note that I discuss both total Company and New Mexico jurisdiction generation fleet capital investment and operating costs. EPE witness Adrian Hernandez, in his direct testimony, addresses allocations of these costs.

Q7. WHAT DOES EPE MEAN BY LOCAL GENERATION?

A. "Local" generation refers to the power produced by EPE's local fleet of its owned generating units. Local generation includes Copper, Montana, Newman, and Rio Grande Power Station units, all of which are gas-fired units.

III. OVERVIEW OF EPE'S SYSTEM

Q8. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?

A. The purpose of this section of my testimony is to provide an overview of EPE's system.

Q9. PLEASE DESCRIBE EPE'S SYSTEM.

A. EPE's service territory covers approximately 10,000 square miles extending from Van Horn, Texas, to El Paso to Las Cruces, New Mexico and then further north to Hatch, New Mexico. To serve its customers, EPE uses various resources, including both local and remote generation. Local generating resources are discussed in more detail later in my testimony, while EPE witness Victor Martinez addresses the remote base-load generation resources at Palo Verde Generating Station ("PVGS") in Phoenix, Arizona, and the renewable resources added since EPE's last base rate case in 2020. EPE has local generation resources that are interconnected to EPE's local transmission network. To access and deliver this power, EPE utilizes its

345-kV transmission system in southern New Mexico as well as various transmission and exchange agreements.

IV. EPE'S LOCAL GENERATION FLEET OPERATION AND MAINTENANCE

Q10. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?

A. The purpose of this section of my testimony is to describe the Company's fleet of local power plants. I also generally describe how the fleet is operated and the measures used to analyze the power plants' performance (for example, heat rate), together with EPE's O&M practices.

A. EPE'S GENERATING FACILITIES

Q11. WHAT ARE EPE'S GENERATING FACILITIES?

A. EPE meets the bulk of its customers' electrical requirements with power produced at its generating stations, which are fueled by a mix of renewable resources, natural gas, and uranium. Table JMH-1 identifies EPE-owned generating stations and its larger third-party renewable resources, with nominal capacities and fuel types, as of the end of Test Year Period.

/

/

/

Table JMH-1

Generating Station	Net Peak Capacity (MW)	Primary Fuel Type	Secondary Fuel Type	Duty
Palo Verde (Units 1, 2, and 3)[1]	622	Uranium	N/A	Base load
Rio Grande (Units 7, 8, 9)	270	Natural Gas	N/A	Peaking and Load-following
Newman[2] (Units 1, 2, 3, 4, 5, and 6)	887	Natural Gas	N/A	Peaking and Load-following; for Unit 5, load following and base load in combined cycle mode
Copper (Unit 1)	49	Natural Gas	N/A	Peaking
MPS (Units 1, 2, 3, and 4)	352	Natural Gas	Diesel	Peaking and load-following
TX Community Solar Facility[3]	3	Solar	N/A	Dedicated Facility for Customers in the Texas Community Solar Program
Newman Solar[4]	10	Solar	N/A	Purchased Power Agreement
Chihuahuan Desert Solar	10	Solar	N/A	Dedicated Facility for Customers in the Texas Community Solar Program
Holloman Air Force Base Solar Facility[5]	5	Solar	N/A	Dedicated Facility for Holloman Air Force Base
New Mexico State University Solar/Battery Facility[6]	3/1	Solar/Battery Storage	N/A	Dedicated Facility for New Mexico State University
Buena Vista Energy Center	120/50	Solar/Battery Storage	N/A	Purchase Power Agreement, System Resource
Sun Edison	22	Solar	N/A	NM Dedicated Purchase Power Agreement
NextEra	5	Solar	N/A	NM Dedicated Purchase Power Agreement
Roadrunner	20	Solar	N/A	NM Dedicated Purchase Power Agreement
Macho Springs Solar, LLC	50	Solar	N/A	Purchase Power Agreement, System Resource
Milagro Solar[7]	150/75	Solar/Battery Storage	N/A	TX Dedicated Purchase Power Agreement
Felina[8]	150	Solar	N/A	TX Dedicated Purchase Power Agreement
Total	2,694			

[1] The 622 MW Palo Verde capacity is the total capacity owned by EPE, including approximately 40 MW from Unit 3 that are not serving either Texas or New Mexico.
[2] The 887 MW Newman capacity is the total capacity owned by EPE including approximately 228 MW from Unit 6 that are not certificated for service to New Mexico.
[3] Customer Dedicated Resources, the costs of which are not included in base rates.
[4] 2 MW are dedicated to TX Community Solar.
[5] Customer Dedicated Resources, the costs of which are not included in base rates.
[6] Customer Dedicated Resources, the costs of which are not included in base rates.
[7] Texas Dedicated Resource, the costs of which are not included in base rates.
[8] Texas Dedicated Resource, the costs of which are not included in base rates.

The Newman and Copper power plants are located in EPE's Texas service area within the City of El Paso, Texas. The Rio Grande power plant is located in EPE's southern New Mexico service area within the City of Sunland Park, New Mexico. The Montana Power Station ("MPS") is located in EPE's Texas service territory just east of the City of El Paso, in unincorporated El Paso County. The Copper, Newman, Rio Grande, and MPS generating stations are considered EPE's "local" generation. EPE also owns several small solar facilities with a combined capacity of approximately 8 MW. Exhibit JMH-1 and JMH-2 are maps depicting the location of EPE's local generating stations. Palo Verde, which is located in Arizona, is considered EPE's remote generation. EPE witness Martinez addresses EPE's rate requests related to those costs and operations.

Q12. ARE ALL OF THE GENERATING FACILITIES INCLUDED IN THE ABOVE TABLE JMH-1 AVAILABLE TO SERVE NEW MEXICO LOAD AND ALLOCATED TO ALL NEW MEXICO CUSTOMERS?

A. Except for Community Solar, Newman Unit 6, and Palo Verde Unit 3, all resources in the above table serve New Mexico customers. Additionally, the costs of the solar facilities at Holloman Air Force Base and New Mexico State University are directly assigned to those customers, as explained by EPE witness Hernandez.

Q13. WHY IS EPE'S LOCAL GENERATION NECESSARY?

A. EPE's local generation is necessary for four primary reasons. First, generation from EPE's local fleet augments its remote generation to meet customer power needs. Second, local generation is necessary to better follow load as customer energy demand changes or as energy output from renewable resources changes. Third, local generation provides load-serving reliability if transmission constraints or outages affect EPE's ability to import energy from remote generation. Fourth, EPE's local generating fleet provides voltage support, grid stability, and resiliency throughout EPE's system.

B. LOCAL UNIT OPERATION AND PERFORMANCE

Q14. PLEASE BRIEFLY DESCRIBE THE TYPICAL USAGE OF EPE'S LOCAL GENERATION.

A. Generally, EPE's local generation units are used to follow load and compensate for the variable output of renewable resources, provide grid stability, and serve EPE's load obligations. For the most part, each of the local units can be used interchangeably to satisfy these functions. EPE's load demands are such that, under normal conditions, the older steam units (Newman Units 1, 2 and 3, and Rio Grande Units 7 and 8) are typically backed down to their minimum loads for the low load hours during off-peak periods and are allowed to be economically dispatched during the higher load periods of the daytime peak periods, particularly during the summer. Rio Grande Unit 9 and the MPS units are designed and are routinely

cycled to meet varying load demands or to displace less efficient generation. Rio Grande 6 has not been included in EPE's rates since 2016.

Q15. HOW DOES EPE MATCH ITS LOCAL UNITS TO LOAD REQUIREMENTS TO ENSURE THAT UNITS ARE AVAILABLE TO MEET DEMAND?

A. For daily operations, the Company's load demand profile requires that Newman Units 1 through 4 and Rio Grande Units 7 and 8 be used primarily as load following units. Rio Grande Unit 8 is also used for voltage and reactive support for the system. Rio Grande Unit 9, and MPS Units 1 through 4 are fast-start units that can be cycled and dispatched to meet load obligations and in response to rapidly changing load conditions. The Copper Power Station is a simple cycle combustion turbine generator that is typically used as a peaking unit. It is subject to start-stop cycles but is also used for load following and to meet spinning reserve requirements. Newman Unit 5, when operating in combined cycle mode, is mostly reduced to minimum load during the mid-morning to early-afternoon hours and is base loaded during peak periods and at night based on typical dispatching needs. It can also return to simple cycle peaking mode if needed.

Q16. DOES THE OPERATION OF EPE'S LOCAL GENERATION FOR PRIMARILY LOAD FOLLOWING AND VOLTAGE SUPPORT

PURPOSES AFFECT THE UNIT EFFICIENCY LEVELS?

A. Yes, especially given the age of these units. Units that are cycled or dispatched to follow daily load fluctuations experience increased mechanical stress due to frequent changes in thermal gradients. These thermal cycles accelerate normal wear and tear experienced by the generating unit, which, in turn, cause losses in efficiency and availability. Additionally, operating at lower output levels during off-peak hours further diminishes efficiency. It is important to note that most units in EPE's local fleet--specifically Rio Grande Units 7 and 8 and Newman Units 1 through 4--were originally designed and built to serve as base load units. However, these units are now used to follow load and compensate for the variable output of renewable resources, provide grid stability, and serve EPE's load obligations that exceed those met through the import of low-cost remote generation. In contrast, Rio Grande Unit 9 and MPS Units 1 through 4 are designed to be ramped up and down as needed and therefore allow EPE to meet customer load expectations and renewable generation fluctuations more efficiently.

Q17. HAVE THERE BEEN OTHER CHANGES SINCE THE LAST RATE CASE THAT HAVE IMPACTED THE GENERAL OPERATION OF THE LOCAL GENERATION FLEET?

A. Yes. In April of 2023, El Paso Electric officially began participating in CAISO's Energy Imbalance Market ("EIM"). The EIM is allowed to dispatch EPE's

participating generating units based on economics. EPE's participation in the EIM resulted in approximately $15.2 million in total benefits over the Base Period, with $2.3 million of those benefits directly allocated to New Mexico customers. Please see the direct testimony of EPE witness Martinez for more details regarding EPE's participation in the EIM and the resulting benefits realized by EPE customers.

Q18. HAS PARTICIPATION IN THE EIM INCREASED O&M COSTS FOR EPE?

A. Yes. In addition to the costs to launch EPE's participation in the market, EPE's local generation fleet has experienced additional starts, run hours, and an increase in unit capacity factors since joining the EIM, particularly with its simple-cycle combustion turbine fleet. The maintenance on these units is determined by the accumulation of run hours and number of times the unit is started. Increasing either the run hours or number of starts will contribute to more frequent maintenance intervals. This has resulted in additional costs and more frequent forced outages on several units. Please see Figures JMH-1 through JMH-4 below for additional information on the associated impacts from EIM that I just described.

Q19. IS THE AGE OF EPE'S LOCAL GENERATING FLEET AN IMPORTANT

CONSIDERATION WHEN EVALUATING UNIT PERFORMANCE?

A. Yes. In broad terms, EPE's local generation is composed of both very new and very old units. Four of EPE's local units are over 57 years old (Rio Grande Unit 7 and Newman Units 1, 2, and 3). Newman Unit 4 entered service in 1975 and is near the end of its operating life. Power plants of that age become less efficient, have less flexible operating characteristics, and are more costly to operate and maintain. After meeting the must-run conditions, different factors are considered. Cost is typically the primary consideration, followed by the efficiency of the unit (*i.e.*, its heat rate). However, EPE's older units, notwithstanding cost or efficiency, are sometimes dispatched first to provide base load power because they are less adaptable to cycling. Additionally, as more solar resources are added to the grid (both utility scale and rooftop solar), these older units are less able to adjust to fluctuations in solar energy output. Unless reliability must-run conditions exist, unit commitment will be based on the lowest heat rate first, thus having the effect of dispatching older units last.

Q20. ARE THERE ANY UNIQUE CHALLENGES EPE ENCOUNTERS RUNNING OLDER, LESS EFFICIENT UNITS?

A. Yes, there are challenges. Safety is a core value of El Paso Electric, and aging components, equipment and infrastructure pose an increased safety hazard for employees when working around older units relative to newer units. Failure types

and frequencies increase as components and equipment age. For example, steam piping walls thin, valves can leak or seize, insulation degrades, and metal fatigue and creep increase, all of which create potentially hazardous conditions. In addition, as components age, the Original Equipment Manufacturers stop supporting the equipment, making repair and replacement difficult and often expensive.

Q21. HOW DOES THE COMPANY MONITOR THE PERFORMANCE OF ITS LOCAL GENERATING UNITS?

A. EPE monitors the performance of its local generating units using two key indicators or measurements: (1) net heat rate and (2) equivalent availability factor ("EAF"). Both net heat rate and EAF are industry-accepted measurements of generating unit performance. Net heat rate is used to monitor unit thermal efficiency, while EAF is used to measure unit availability based on the percentage of time within a given period that a unit is available to generate electricity to serve customer load. EAF is monitored more closely during the summer season when unit availability is crucial for ensuring the region's safety, security, and comfort. As a result, summer peak EAF is included in EPE's corporate Key Performance Indicators for organizational performance. The summer peak season for EPE is from June to September.

Q22. WHY DOES EPE USE EAF AS AN INDICATOR OF PERFORMANCE?

A. The EAF metric takes into account all events that affect availability, rather than focusing on a single type of event. EAF represents the percentage of time that a unit is available to produce electricity considering all planned and unplanned outages and de-rates. EAF provides a clear indication of overall unit availability for a given period. For EPE, that period is June through September because EPE is a summer-peaking utility.

Q23. IS IT REALISTIC TO EXPECT GENERATING UNITS TO ATTAIN 100 PERCENT AVAILABILITY?

A. No. One-hundred percent availability is not realistically attainable over an extended period of time. Scheduled maintenance is always necessary to maintain acceptable levels of overall unit integrity, and other events and conditions may affect unit availability during the normal course of business (*e.g.*, environmental operating constraints and unplanned outages caused by unforeseen events).

Q24. HOW DOES NET HEAT RATE REFLECT UNIT EFFICIENCY?

A. A unit's net heat rate is defined as the amount of fuel energy (measured in British thermal units ("Btu")) used to produce one kilowatt-hour ("kWh") of electricity delivered to the transmission system. Efficient power generation equates to less fuel consumed to produce a kWh and therefore lower fuel costs. A lower net heat

rate means the turbine generator is more efficient than a unit with a higher net heat rate. Additionally, because carbon emissions are a direct function of fuel consumption, a more efficient unit emits less carbon and other pollutants per unit of energy produced. The goal in determining the operation of a generation unit is to maintain a reasonable level of efficiency.

Q25. DO EPE'S LOCAL GENERATING UNITS MAINTAIN CONSISTENT NET HEAT RATES, AND ARE THEY REASONABLE HEAT RATES?

A. Yes. EPE's local generating units maintain consistent and reasonable net heat rates, especially given the advanced age of some of the units. The annual variances of the heat rates for EPE's local generating fleet efficiency are minimal and are within an acceptable range of reasonable and prudent operations. As Table JMH-2 below shows, the annual average composite net heat rates for EPE's local generating fleet demonstrate that EPE maintained consistent and reasonable levels of efficiency during the Base Period, which is representative for the Test Year Period.

/

Montana 4	9,253	2016	Gas Turbine/Jet Engine-LMS 100

C. OPERATION AND MAINTENANCE OF LOCAL GENERATION

Q26. WHAT STEPS DOES EPE TAKE TO MAINTAIN THE EFFICIENCY AND AVAILABILITY OF ITS LOCAL GENERATING FLEET?

A. EPE conducts a comprehensive maintenance program that is designed to maximize the efficiency and availability of its generation units. The three cornerstones of EPE's maintenance practices are regularly scheduled maintenance, preventive maintenance, as well as a predictive maintenance program. Additionally, EPE has

[9] Newman Unit 1 was out of service during the Test Year period.

a seasonal readiness program designed to prepare the plants for the winter and summer seasons.

Q27. WHAT ARE EPE'S SCHEDULED MAINTENANCE ACTIVITIES?

A. Personnel from EPE's power generation operations, maintenance, system operations, and power marketing work collaboratively to schedule the timing and duration of planned outages to minimize the economic impact of planned maintenance, subject to system reliability, on our system and for our customers. EPE's scheduled maintenance activities include periodic inspections, major unit overhauls, and other planned maintenance intended to maximize unit availability and efficiency, as well as capital projects that improve generation reliability and/or efficiency.

A major unit overhaul is a more comprehensive inspection where EPE takes a unit out of service to open, clean, and inspect it for degradation of major components, primarily in the turbine and generator, and then repairs, refurbishes, or replaces components as needed to maintain and improve efficiency and reliability.

Between major overhauls, EPE also conducts routine scheduled maintenance on a variety of unit components (e.g., boiler, turbine control valves, and auxiliary equipment) when unit efficiency or availability is likely to be

impacted by the failure or potential failure of a unit's components or associated sub-components.

Q28. WHAT IS EPE'S PREVENTIVE MAINTENANCE PROGRAM?

A. EPE's preventive maintenance program is the practice of performing routine, proactive equipment maintenance. This preventive maintenance is conducted not only during maintenance outages, but also throughout the year while the units are under normal operation. Preventive maintenance includes systematic inspection and routine tasks that are designed to keep equipment in sound operating condition and minimize degradation of equipment. EPE evaluates original equipment manufacturers' ("OEM") data, equipment operating history, and operating experience in conjunction with the relative significance of a generating unit's components and the associated risk of failure to determine the type of preventive maintenance required. If necessary, EPE schedules a preventative maintenance outage to better inspect equipment and undertake maintenance work prior to the time the equipment is expected to fail. EPE's preventive maintenance program is designed to ensure greater control over the scheduling of maintenance activities, which can minimize the duration and cost associated with the outages.

Q29. DOES EPE ALSO FOLLOW PREDICTIVE MAINTENANCE PROCEDURES?

A. Yes. EPE monitors equipment operations through various inspection techniques and utilizes statistical control measures in conjunction with actual equipment operating history to predict when to perform maintenance on a unit or component part prior to failure. The data gathered assists with work planning and allows EPE to predict the parts that will be required during an actual outage or repair phase. Predicting when a component part is expected to fail also provides EPE more control over scheduling maintenance and thus controlling costs.

Q30. WHAT ARE SOME OF THE PROCESSES EPE FOLLOWS IN ITS PREDICTIVE MAINTENANCE PROGRAM?

A. EPE conducts continuous unit performance monitoring, as well as pre- and post-overhaul unit performance testing, steam path inspections during overhauls, critical equipment vibration monitoring, motor circuit evaluation for critical motors, and lubricant oil analysis. EPE uses infrared thermography throughout the plants to detect problems with electrical systems, boilers, and other equipment. Airborne ultrasonic monitoring is used for compressed gas leak detection, electrical discharge/corona identification, and steam trap cycling. Ultrasonic thickness testing is performed on reheat superheater and internal boiler tubes. Additionally, oil conditional analysis is used to determine the lubricant's lubricity as well as to monitor signs of equipment degradation. These predictive maintenance processes provide EPE's maintenance and operations teams with more options in planning

and scheduling maintenance and minimizing costs. The alternative would be to wait for equipment to fail, which would result in unplanned unit outages, equipment downtime, and would very likely require expedited repairs and delivery of replacement parts and introduce other costly and inefficient processes into the O&M programs. EPE has also implemented an advanced pattern recognition ("APR") program to monitor chemistry and rotating equipment for aberrations in operating behavior. APR utilizes artificial intelligence machine-learning algorithms to detect differences between expected and actual equipment behavior that can point towards equipment condition degradation or impending failure.

Q31. ARE EPE'S PREDICTIVE AND PREVENTIVE MAINTENANCE PROGRAMS IMPLEMENTED IN ALL ASPECTS OF UNIT OPERATIONS?

A. No. Many of the technologies available are not readily adaptable to all systems of generating units. EPE's preventive and predictive maintenance practices focus on rotating equipment and are being applied to other areas of the plant. During operation of a plant, these practices cannot be applied to internal components such as boiler tubes or within the condenser. However, during both major and preventive outages, ultrasound equipment and other inspection methods are used to evaluate and identify tube leaks in boilers, condensers, heat exchangers and high energy piping.

Q32. EPE'S LMS 100 UNITS EMPLOY A MORE MODERN TECHNOLOGY THAN THE OLDER UNITS. WHAT TOOLS ARE AVAILABLE TO EPE TO MAINTAIN THE LMS 100 TECHNOLOGY?

A. It is accurate to say that EPE's newer LMS 100 units (Rio Grande 9 and the four MPS units) employ more modern technology than the older units. Through General Electric (the manufacturer of the LMS 100 units), EPE has a remote monitoring and diagnostic program. General Electric has a team staffed by former field service and controls personnel who continually monitor the performance of all five of the Company's LMS 100 units remotely. The team provides early warning alerts and, in case of more severe operating conditions, the team notifies EPE and supports EPE in resolving the issue.

Q33. ARE EPE'S COSTS FOR ITS LOCAL GENERATING FLEET MAINTENANCE PRACTICES NECESSARY AND REASONABLE?

A. Yes. EPE relies heavily on its local generation to meet customers' load. Having a sound maintenance program is a cornerstone to achieving that. EPE could not serve its customers without high availability of its local generation. Maintaining EPE's fleet at performance levels that support demand requires funding for operations and maintenance. As I described previously, EPE deploys preventive, corrective, and predictive maintenance programs to effectively operate and maintain its local

generation fleet. These programs have led to very good operational performance of the local fleet. EPE's strong EAF of 92.9[10] percent during the summer 2025 peak period was a result of the reasonable and necessary expenditures required to maintain performance.

Q34. FOR THE TEST YEAR PERIOD, ARE THE COMPANY'S OPERATION AND MAINTENANCE PROGRAMS AND PRACTICES NECESSARY AND REASONABLE?

A. Yes, EPE's operation and maintenance programs are based on engineering data gathered to set the intervals between inspections. This practice conforms to industry-wide acceptable standards. EPE's Test Year Period costs are necessary and reasonable.

V. SUPPORT FOR REVENUE REQUIREMENTS AND RATE BASE FOR LOCAL GENERATION FLEET

Q35. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?

A. The purpose of this section of my testimony is to provide support for EPE's total Company revenue requirements for non-fuel O&M costs related to local generation, and for capital additions to be included in rate base. The non-fuel O&M

[10] Rio Grande Unit 7 and Newman Unit 1 are not included in the peak (June-September) 2025 EAF calculation.

costs for the Test Year Period are based upon Base Period costs after all proper adjustments that are necessary, reasonable, and representative of the Test Year Period. The capital additions included for rate base were added to plant in service after the end of the 2019 Historical Test Year Period used in the 2020 Rate Case up to the end of the Base Period in this case ending September 30, 2025, as adjusted for October 2025.

My testimony will show that the Test Year Period costs for non-fuel O&M and capital additions are just and reasonable.

A. LOCAL GENERATION FLEET TEST YEAR PERIOD NON-FUEL O&M

Q36. DID EPE'S LOCAL GENERATING UNITS PERFORM AT A REASONABLE LEVEL DURING THE TEST YEAR PERIOD WITH RESPECT TO AVAILABILITY?

A. For the years 2021 through 2024, EPE achieved consistently high levels of availability during the summer peak periods (June through September), when availability matters the most to EPE's customers. For the Test Year period, the average EAF for all units during the summer peak months of June through September 2025 was 92.93 percent. Table JMH-3 below summarizes this information.

Table JMH-3	
Year (June 15 through September 15)	**Total Peak EAF Average (%)**
2021	94.2
2022	96.47
2023	91.19
2024	90.86
Test Year	92.93[11]

Q37. WHY ARE RIO GRANDE UNIT 7 AND NEWMAN UNIT 1 NOT INCLUDED IN THE ABOVE EAF CALCULATION?

A. Rio Grande Unit 7 and Newman Unit 1 are not included in the EAF calculation because they are no longer maintained for continuous availability. These units are each over 65 years old and among the oldest in EPE's fleet. Due to their age, EPE does not budget for ongoing maintenance of the units as it is not cost-effective. Instead, Rio Grande Unit 7 and Newman Unit 1 are kept in reserve and operated only when needed to support reliability. Since EAF measures the performance of units that are actively maintained and scheduled for regular operation, including these units would misrepresent the metric. Excluding them ensures the calculation reflects resources that are managed for consistent availability

Q38. DURING THE TEST YEAR PERIOD, DID EPE ACHIEVE REASONABLE

[11] Note that total Peak EAF Average % does not include Rio Grande Unit 7 or Newman Unit 1.

LEVELS OF UNIT EFFICIENCY FOR ITS LOCAL GENERATION?

A. Yes, the efficiency of the units as defined by heat rate was reasonable, particularly given the age of some of the units. The system had an overall system heat rate of 9,935 Btu/kWh[12]. As previously discussed, the older units had an average heat rate of 10,536 Btu/kWh[13] and the newer units had a combined heat rate of 9,471 Btu/kWh[14]. This is consistent with historical performance, type, and vintage of these units.

Q39. WHAT IS THE AMOUNT OF NON-FUEL O&M COSTS FOR EPE'S LOCAL GENERATION FLEET?

A. During the Test Year Period, EPE's non-fuel O&M, excluding administrative and general costs, were $57.2 million. Adjustments to non-fuel O&M and rate base are addressed later in my testimony and by EPE witnesses Steven A. Sierra and Cynthia S. Prieto.

Q40. ARE THE TEST YEAR PERIOD NON-FUEL O&M COSTS FOR LOCAL GENERATION REASONABLE AND NECESSARY?

[12] This net heat rate takes into account Newman Unit 6 which is not included in New Mexico rate base.
[13] This net heat rate takes into account Newman Unit 2, Newman Unit 3, Newman Unit 4, Rio Grande Unit 6 and Rio Grande Unit 7.
[14] Net heat rate takes into account Montana Units 1 through 4, Rio Grande Unit 9 and Newman Unit 6.

A. Yes. The Test Year Period costs are reasonable and necessary to operate and maintain the local generation units. As discussed in detail previously in my testimony, EPE combines preventive and predictive maintenance programs with engineering data to determine optimal maintenance intervals. Maintenance on the units is performed by EPE personnel as well as contractors. When a contract workforce is utilized, EPE uses a competitive bidding process to keep performance high at a reasonable cost. These programs and the flexibility of contract workers have led to strong availability factors for the units during peak demand as evidenced by the 92.93 percent EAF for 2025. These costs are prudently incurred to maintain a safe and reliable local fleet.

B. CAPITAL ADDITIONS TO LOCAL GENERATION FLEET

Q41. WHAT IS EPE'S APPROACH FOR CAPITAL ADDITIONS FOR ITS LOCAL GENERATING FLEET?

A. EPE strives to maintain efficient and reliable power plant operations. This requires capital projects that improve performance, availability, and reliability of EPE's local generation fleet. To determine appropriate, reasonable, and timely capital investments for meeting these goals, EPE assesses current and future energy needs, evaluates available technologies, and considers regulatory and environmental requirements.

Q42. IS THERE A LIST OF THE MAJOR PRODUCTION PLANT CAPITAL ADDITIONS TO THE LOCAL GENERATION FLEET THAT EPE SEEKS TO INCLUDE IN RATE BASE?

A. Yes. EPE witness Prieto, in her Exhibit CSP-1, presents a list of all plant additions that EPE made between October 1, 2024, and September 30, 2025, including those for local generation, adjusted for October 2025. The local generation capital additions fall under the "Steam Production" and "Other Production" categories in her exhibit. The total Company amount of local generation capital additions is $559,326,837 ($68,583,245 New Mexico jurisdictional). My testimony establishes the reasonableness and prudence of the capital expenditures for these projects.

Q43. WHAT ARE THE LARGE LOCAL GENERATION CAPITAL ADDITIONS THAT EPE SEEKS TO INCLUDE IN RATE BASE?

A. I use a $5 million threshold to identify large capital additions. Capital additions over $5 million related to EPE's local generation, as identified in EPE witness Prieto's Exhibit CSP-1, that EPE is requesting to be included in rate base are listed below in Table JMH-4:

/

/

/

/

TABLE JMH-4

Line No.	Local Generation Capital Additions (Over $5M Total Company)	Total Company Amount ($)	NM Jurisdiction Amount ($)	Plant In Service Date

[15] Newman Capital Improvement Blanket $854,959 Newman Unit 6 capital additions are not included in the New Mexico Jurisdiction Amount.

1. PROJECT NO. 1: NEWMAN CAPITAL IMPROVEMENT BLANKET

Q44. THE FIRST PROJECT LISTED IS THE NEWMAN CAPITAL IMPROVEMENT BLANKET. WHAT ARE THE TYPES OF PROJECTS INCLUDED IN THE NEWMAN CAPITAL IMPROVEMENT BLANKET WORK ORDER? GIVE EXAMPLES AND STATE WHY THE PROJECTS WERE UNDERTAKEN.

A. The Newman Capital Improvement Blanket includes capital improvements at Newman Power Station, including small capital projects (those with costs expected to be less than $200,000) that do not receive individual capital project numbers and small continuous improvement capital expenditures. Examples of the capital expenditures included in the Newman Capital Improvement Blanket are work on boilers, pumps, motors, compressors, valves, heat exchangers, piping systems, reverse osmosis systems, battery back-up systems, electrical systems, seasonal readiness, and other miscellaneous capital improvements. Note that while the Newman Capital Improvement Blanket project includes Newman 6 work orders, those amounts were not allocated to New Mexico.

Q45. CAN YOU PLEASE EXPLAIN HOW MANAGEMENT DETERMINES THE NEED FOR A PROJECT ASSIGNED TO THE BLANKET?

A. Projects are assigned to the blanket when the estimated project costs are expected to be below $200,000. These projects typically arise as a result of discovery work (inspections or outages), equipment failure analyses, and critical equipment assessments, and they include projects that are continuous equipment improvement projects with annual costs below $200,000.

Q46. IS THERE A LISTING OF CAPITAL PROJECTS INCLUDED IN THE NEWMAN CAPITAL IMPROVEMENT BLANKET WORK ORDER?

A. Yes. Exhibit JMH-04 contains a list of all the projects with costs that were expected to be under $200,000 with brief descriptions of each. Capital blankets may also include capital projects above $200,000 when the project cost was initially estimated to be under $200,000, but the project experienced unforeseen change orders during implementation that increased the project cost above the blanket cap.

Q47. WERE THE COSTS FOR THE NEWMAN CAPITAL IMPROVEMENT BLANKET JUST AND REASONABLE?

A. Yes, these costs were reasonable and necessary for EPE to continue to provide safe, efficient and reliable service from the generating units at its Newman Power Station. Maintaining, modifying and improving plant equipment is a necessary undertaking to improve plant reliability, manage costs, and extend the useful life of

existing equipment. The costs incurred for these projects were reviewed under strong budget controls and informed by reasonable management decision making.

Q48. CAN YOU PLEASE DESCRIBE THE BUDGETARY CONTROLS MENTIONED IN YOUR PREVIOUS ANSWER?

A. Projects included in capital blankets follow EPE's procurement policies, whereby projects are formally bid out if costs are expected to be above $100,000. Informal bids (price quotes) are encouraged when project costs are expected to be below $100,000. Additionally, the blanket projects are regularly reviewed and approved by EPE's executive leadership team during the annual Capital Budgeting Process or through a monthly budget reforecasting process.

2. PROJECT NO. 2: RIO GRANDE UNIT 8 HP/IP TURBINE IMPROVEMENT PROJECT

Q49. THE SECOND PROJECT LISTED IS THE RIO GRANDE UNIT 8 MAJOR HIGH PRESSURE/INTERMEDIATE PRESSURE (HP/IP) TURBINE IMPROVEMENTS PROJECT. WHAT WAS THIS PROJECT AND WHY WAS IT UNDERTAKEN?

A. The Rio Grande Unit 8 Major HP/IP Turbine Improvements Project was a planned scheduled project undertaken to open and inspect the major turbine components and replace/refurbish as needed. Once the unit had been opened and inspected, the team identified the need for work to refurbish the rotor and inner cylinder shell; to

replace blades, diaphragms, blade rings, seals, brackets; and for miscellaneous refurbishment of blade welds and various valve components. Additionally, the generator radial leads required refurbishment, and the full turbine/generator train required realignment. This project re-established efficient and effective operations of the unit in accordance with the original design specifications of the equipment. The in-service date for this project was June 12, 2022.

3. PROJECT NO. 3: RIO GRANDE BLANKET PROJECT

Q50. THE THIRD PROJECT IN YOUR LARGE CAPITAL ADDITIONS TABLE ABOVE IS THE RIO GRANDE CAPITAL IMPROVEMENT BLANKET. WHAT ARE THE TYPES OF PROJECTS INCLUDED IN THE RIO GRANDE BLANKET WORK ORDER?

A. The Rio Grande Capital Improvement Blanket includes capital improvements at the Rio Grande Power Station, including small capital projects that do not receive individual capital project work order numbers. Examples of the small capital projects at the Rio Grande Power Station include work on boilers, pumps, motors, compressors, valves, heat exchangers, piping systems, reverse osmosis systems, battery back-up systems, electrical systems, seasonal readiness, and other miscellaneous capital improvements. The Rio Grande Capital Improvement Blanket project excludes any items that were related to Rio Grande Unit 6 since that unit is not included in New Mexico rate base.

Q51. IS THERE A LISTING OF CAPITAL PROJECTS INCLUDED IN THE RIO GRANDE CAPITAL IMPROVEMENT BLANKET WORK ORDER?

A. Yes. Exhibit JMH-04 contains a list of all the projects under $200,000 with brief descriptions. Capital blankets may also include capital projects above $200,000 when the project cost was initially estimated to be under $200,000, but the project experienced unforeseen change orders during implementation that increased the project cost above the blanket cap.

Q52. CAN YOU PLEASE EXPLAIN HOW MANAGEMENT DETERMINED THE NEED FOR A PROJECT ASSIGNED TO THE RIO GRANDE BLANKET?

A. As previously noted in my testimony regarding the Newman Capital Blanket project, projects are assigned to blankets when the total estimated project costs are expected to be below $200,000 and often arise as a result of inspections, scheduled or unscheduled outages, equipment failure analyses, and critical equipment assessments

4. PROJECT NO. 4: NEWMAN UNIT 4 GAS TURBINE 1 SPARE TURBINE COMPONENT PROJECT (440 REPORT NO. 98)

Q53. THE FOURTH PROJECT IN YOUR LARGE CAPITAL ADDITIONS

TABLE ABOVE IS THE NEWMAN UNIT 4 GAS TURBINE 1 SPARE TURBINE COMPONENTS. WHAT WAS THIS PROJECT AND WHY WAS IT UNDERTAKEN?

A. The Newman Unit 4 Spare Turbine Components project involved the purchase and use of a replacement set of rotating, stationery, and combustion components for the gas turbine to replace aging parts that had exceeded their serviceable life. These components have long-lead times and therefore had to be purchased in advance of the planned outage to execute the work in an efficient and effective manner. This project, along with the subsequent planned outage project, re-established safe and reliable operation of the unit in accordance with the design specifications of the equipment. These components were installed on Unit 4 GT-1 during the major planned outage for this unit during the Base Period.

Q54. DID EPE FILE AN AMENDED 440 REPORT FOR THIS PROJECT?

A. Yes. The project exceeded its estimated costs by about $21.7 million ($4.4 million New Mexico jurisdictional), resulting in an 813% variance from the original estimate filed in Rule 440 report No. 98. This project was undertaken as part of the major inspection to address components critical to maintaining system reliability. The primary driver for the cost increase was the discovery of a significant oil leak along with several other mechanical problems identified during the inspection, and the need to replace the rotor. The problems included severe line blockages caused

by varnish buildup, degraded oil, and incorrectly sloped vent lines. Further inspection revealed the need for extensive repairs to the generator including corrections to insufficient wicking application, inadequate bearing saddles, and loose generator wedges. Due to the magnitude of these repairs, additional staffing was required, including a night shift crew and a confined-space rescue team, to ensure safety and continuous progress on the worksite. Given the nature of the issues discovered, many of which could not have been identified prior to inspection and disassembly, the amended projects' costs were both necessary and reasonable.

Note that Rule 440 Report No. 98 also includes amounts related to these other major capital projects: Project No. 15 (Newman Unit 4 Gas Turbine Major Inspection) accounts for the majority of labor costs, and Project No. 16 (Newman Unit 4 Gas Turbine 1 – Spare Bladed Rotor), which reflects the cost of procuring the replacement rotor. The amended total of Rule 440 Report No 98, therefore, encompasses the rotor purchase, component installation, and increased inspection-related costs

5. PROJECT NO. 5: NEWMAN UNIT 4 GAS TURBINE 2 SPARE TURBINE COMPONENT PROJECT (440 REPORT NO. 99)

Q55. THE FIFTH PROJECT IN YOUR LARGE CAPITAL ADDITIONS TABLE IS THE NEWMAN UNIT 4 GAS TURBINE 2 SPARE TURBINE COMPONENTS. WHAT WAS THIS PROJECT AND WHY WAS IT

UNDERTAKEN?

A. Similar to Newman Gas Turbine 1, the Newman Unit 4 Gas Turbine 2 Spare Turbine Components project involved the purchase and use of a replacement set of rotating, stationary, and combustion components for the gas turbine to replace aging parts that had exceeded their serviceable life. These components are long-lead items and needed to be purchased in advance of the planned outage to execute the work in an efficient and effective manner. This project, along with the subsequent planned outage project, re-established safe and reliable operation of the unit in accordance with the design specifications of the equipment. These components were installed on Unit 4 GT-2 during the major planned outage for this unit.

Q56. DID EPE FILE AN AMENDED 440 FOR THIS PROJECT?

A. Yes. The project exceeded its estimated costs by about $20.8 million ($4.2 million New Mexico jurisdictional), resulting in a 858% variance from the original estimate filed in Rule 440 report No. 99. This project is much like the amended Rule 440 No.98. Like Unit 4 GT-1, this was part of a major inspection to address critical components to maintain system reliability. The primary driver for the cost increase was the discovery of a significant oil leak along with several other mechanical problems identified during the inspection. These included severe line blockages caused by varnish buildup, degraded oil, and incorrectly sloped vent lines. Further inspection revealed the need for extensive repairs to the generator including

corrections to insufficient wicking application, inadequate bearing saddles, and loose generator wedges. Due to the magnitude of these repairs additional staffing was required, including a night shift crew and a confined-space rescue team, to ensure safety and continuous progress on the worksite. Given the nature of the issues discovered, many of which could not have been identified prior to inspection and disassembly, the amended projects' costs were both necessary and reasonable. Note that Rule 440 Report No. 99 also includes amounts related to these other major capital projects: Project No. 18 (Newman Unit 4 Gas Turbine Major Inspection) which accounts for the majority of labor costs, and Project No. 14 (Newman Unit 4 Gas Turbine 2 – Spare Bladed Rotor), which reflects the cost of procuring the replacement rotor. The amended total, therefore, encompasses the rotor purchase, component installation, and increased inspection-related costs.

6. PROJECT NO. 6: COPPER GAS TURBINE HOT GAS PATH COMPRESSOR CAPITAL IMPROVEMENT PROJECT

Q57. THE SIXTH PROJECT IN YOUR LARGE CAPITAL ADDITIONS TABLE ABOVE IS THE COPPER GAS TURBINE – HOT GAS PATH INSPECTION/COMPRESSOR REPLACEMENT. WHAT WAS THIS PROJECT AND WHY WAS IT UNDERTAKEN?

A. The Copper Gas Turbine Hot Gas Path Inspection/Compressor Replacement project was originally budgeted in order to perform a periodic inspection on the

turbine and compressor. However, unforeseen and unexpected damage to the turbine was identified during the borescope inspection prior to the planned outage. This discovery created the need to order replacement components in advance of the outage. I discuss these replacement parts in more detail below. The unexpected damage subsequently caused an unplanned outage on the unit due to a rotating turbine blade failing and impacting stationary blades, which created the need to begin major inspection and maintenance work earlier than originally scheduled. This work entailed a comprehensive examination of the turbine and casing to identify and address wear and damage and to restore the safe and reliable operation and performance of the unit. Additionally, the compressor hook-fits were reestablished and the spare rotor with the new turbine rotor were installed as part of this project. Finally, the generator stator was rewound.

7. PROJECT NO. 7: NEWMAN 4 STEAM TURBINE REPLACEMENT PROJECT (440 REPORT NO. 97)

Q58. THE SEVENTH PROJECT IN YOUR LARGE CAPITAL ADDITIONS TABLE ABOVE IS THE NEWMAN UNIT 4 STEAM TURBINE MAJOR CAPITAL REPLACEMENT. WHAT WAS THIS PROJECT AND WHY WAS IT UNDERTAKEN?

A. The Newman Unit 4 Steam Turbine Major Capital Replacement project was originally planned and scheduled as a valve outage. While performing a borescope

inspection, the Company identified damage to turbine blades that required replacement. The outage was then reclassified as a major inspection; the damaged turbine components were replaced and extensive maintenance on the generator was performed. This project allowed the unit to continue operating efficiently and effectively in accordance with the design specifications of the equipment. The in-service date of this project was June 10, 2024.

Q59. DID EPE FILE AN AMENDED 440 FOR THIS PROJECT?

A. Yes. The project exceeded its estimated costs by approximately $4.8 million ($1.0 million New Mexico jurisdictional), resulting in an 80% variance from the estimated cost filed in the original Rule 440 report No. 97. The primary cause of this increase stemmed from a necessary Non-Destructive Examination ("NDE") carried out by Siemens on the Unit 4 Steamer. Following the NDE, it was discovered that the L-0 blades in the low-pressure section showed significant trailing edge erosion. Additionally, the Unit 4 Steamer experienced major oil leaks, which were traced to line blockages caused by varnish buildup, coked oil, and improper vent line slopes. Significant additional generator repairs were also needed due to issues such as loose stator wedges, loose generator core, leaks in the radial leads, inadequate wicking application, and insufficient bearing saddles. None of these required repairs could have been identified prior to the NDE, and the amended

cost of the project was necessary and reasonable given the scope of the work required to be performed after the NDE.

8. PROJECT NO. 8: NEWMAN UNIT 3 MAJOR INSPECTION AND CAPITAL IMPROVEMENT PROJECT (440 REPORT NO. 90)

Q60. THE EIGHTH PROJECT LISTED IS THE NEWMAN UNIT 3 MAJOR INSPECTION AND CAPITAL IMPROVEMENTS. WHAT WAS THIS PROJECT AND WHY WAS IT UNDERTAKEN?

A. Initially, this project was scheduled as a major inspection of the turbine and generator and included funds for replacement of some major components. The original budget was $2.8 million for O&M and $700,000 for capital. Like many turbine or generator major inspections and outages, the actual costs can differ substantially once the unit is disassembled for inspection, and the condition of major components has been verified. Common work typically performed during these types of outages includes performing non-destructive testing on critical components; replacing/refurbishing components to restore functionality on main stop valves, control valves, reheat stop valves, intercept valves and blowdown valves; restoring babbit on bearings; and replacing steam seals in the steam path, among various other miscellaneous work. In this case, a series of technical failures pushed the unit into an unplanned shutdown that resulted in equipment damage. Exhibit JMH-3 is an event summary performed by Burns & McDonnell, an EPE

engineering consultant, based upon its independent investigation of the unplanned shutdown.

Q61. WHAT EQUIPMENT WAS DAMAGED AND WHAT WAS THE CAUSE?

A. A failure in the unit's Uninterruptible Power Supply ("UPS") caused the control system battery to run low. As a result, the main AC lube oil system experienced a malfunction. Subsequently, the AC and DC back up lube oil systems were unable to energize, which led to the steam turbine coasting to a complete stop in a short period of time. This stoppage resulted in component damage that included the wiping of bearing, seals, and packing due to the loss of oil. The damage to Newman Unit 3 caused subsequent damage to the generator lagging and turbine enclosure. Weld repairs and machining of the rotor journals, refurbishment of all bearings, repair of all steam seals, and replacement of several rows of blades were needed to get the unit back to its normal operating condition.

Q62. DID THIS DAMAGE RESULT FROM EPE'S IMPROPER OPERATION OR MAINTENANCE OF THE EQUIPMENT?

A. No. EPE prudently operated and maintained this unit. As explained in Exhibit JMH-3, the event summary prepared by Burns & McDonnell, the unplanned outage event was the result of a cascading sequence of multiple equipment failures. A faulty UPS and associated notification systems subsequently caused the back-up

battery system to lose its charge and prevented the backup pumps from starting as needed when the unit experienced the loss of power condition.

Q63. WAS THERE ALSO A PLANNED OUTAGE SCHEDULED FOR NEWMAN UNIT 3 DURING THE TEST YEAR?

A. Yes. A planned outage at Newman Unit 3 was scheduled to begin on November 12, 2023. The planned outage was scheduled for 174 days, which would have kept Newman Unit 3 out of service until May 4, 2024. During that planned outage, EPE intended to conduct a major inspection of the turbine and generator and to perform the common work typically performed during these types of outages that I described above, and the Company had budgeted for potential replacement of major components.

Q64. HOW DID THE FORCED OUTAGE AND REPAIRS REQUIRED TO ADDRESS THAT ISSUE COINCIDE WITH THE PLANNED OUTAGE WORK THAT WAS ALREADY SCHEDULED?

A. As noted, the planned outage was set to occur November 12, 2023, but the unplanned event occurred on June 28, 2023. As a result, much of the work needed to place the unit back in service for the unplanned event would have been required to be performed during the planned outage but was instead performed slightly ahead of schedule during the forced outage. The additional work performed that was

above and beyond what would have been needed during the planned outage effectively extended the useful life of the turbine and generator by approximately five years. Additionally, EPE established that the work would result in a five-year service life extension. The benefit of extending the useful life of the 90-MW Newman Unit 3 for an additional five years is approximately $10.6 million in deferred capital costs. The direct testimony of EPE witness Martinez addresses the analysis performed to estimate the value of extending this unit's useful life by five years.

Q65. WAS THIS EVENT COVERED BY EPE'S INSURANCE POLICY?

A. Yes. EPE's insurance carrier reimbursed EPE approximately $1.8 million net of deductible. EPE's deductible was $5 million. The insurance reimbursement of $1.8 million reduces the cost of the project being requested in this case.

9. PROJECT NO. 9: COPPER GAS TURBINE REPLACEMENT PARTS PROJECT

Q66. THE NINTH PROJECT IN YOUR LARGE CAPITAL ADDITIONS TABLE ABOVE IS THE COPPER GAS TURBINE REPLACEMENT PARTS. WHAT WAS THIS PROJECT AND WHY WAS IT UNDERTAKEN?

A. The Copper Gas Turbine Replacement Parts Project was undertaken to procure long-lead gas turbine replacement parts for the major unit outage at Copper to support the efficient and effective execution of the project. Parts were purchased

in conjunction with and used in the sixth project in Table JMH-4 above, which was the Copper Unit's Hot Gas Path Major inspection project that I just described. These parts included, but were not limited to, combustion baskets, transitions, transition seals, diaphragms, fuel nozzles, compressor blades, vanes, and rotor air cooling pipe.

10. PROJECT NO. 10: MONTANA CAPITAL IMPROVEMENTS BLANKET PROJECT

Q67. THE TENTH PROJECT IN YOUR LARGE CAPITAL ADDITIONS TABLE ABOVE IS THE MONTANA CAPITAL IMPROVEMENTS BLANKET. WHAT ARE THE TYPES OF PROJECTS INCLUDED IN THE MONTANA CAPITAL BLANKET?

A. The Montana Capital Improvements Blanket consists of capital improvements at the Montana Power Station, primarily including capital projects under $200,000 that do not receive individual capital project work order numbers. Examples of the small capital projects at the Montana Power Station include work on pumps, motors, compressors, valves, heat exchangers, piping systems, reverse osmosis systems, battery back-up systems, electrical systems, seasonal readiness, and other miscellaneous capital improvements.

Q68. IS THERE A LISTING OF CAPITAL PROJECTS INCLUDED IN THE MONTANA CAPITAL BLANKET WORK ORDER?

A. Yes. Exhibit JMH-4 contains a list of all the projects under $200,000 with brief descriptions. Capital blankets may also include capital projects above $200,000 when the project cost was initially estimated to be under $200,000, but the project experienced unforeseen change orders during implementation that increased the project cost above the blanket cap.

Q69. CAN YOU PLEASE EXPLAIN HOW MANAGEMENT DETERMINED THE NEED FOR A PROJECT ASSIGNED TO THE MONTANA BLANKET ACCOUNT?

A. As previously noted in my testimony regarding the Newman and Rio Grande Capital Blanket project, projects are assigned to blankets when the total estimated project costs are expected to be below $200,000 and often arise as a result of inspections, scheduled or unscheduled outages, equipment failure analyses, and critical equipment assessments.

11. PROJECT NO. 11: GENERATION OPERATIONS CMMS PROJECT

Q70. THE ELEVENTH PROJECT IN YOUR LARGE CAPITAL ADDITIONS TABLE ABOVE IS THE GENERATION OPERATIONS COMPUTER MAINTENANCE MONITORING SYSTEM PROJECT. WHAT WAS THIS PROJECT AND WHY WAS IT UNDERTAKEN?

A. The Generation Operations CMMS (Computerized Maintenance Management System) Project was undertaken to implement the latest versions of Maximo and WT Time, separating capital and O&M work orders for the plants, and adjusting the PowerPlan/ORACLE interface to allow immediate work order status. The CMMS Project enabled a range of improvements, including capturing estimated costs for capital work orders, converting Q4 historical data, applying single sign-on functionality, and setting up multiple virtual environments for Maximo and WT Time. It also included integration of the CMMS with various systems such as Active Directory, Outlook, and ORACLE, along with creating test procedures, conducting business workshops, and providing training sessions for the Generation Operations team.

12. PROJECT NO. 12: NEWMAN UNIT 4 GT1 & GT2 IMPROVEMENTS

Q71. THE TWELFTH PROJECT IN YOUR LARGE CAPITAL ADDITIONS TABLE ABOVE IS THE NEWMAN UNIT 4 GT1 AND GT2 IMPROVEMENT PROJECTS. WHAT WAS THIS PROJECT AND WHY WAS IT UNDERTAKEN?

A. The project involved the procurement of replacement turbine component parts for the Company's 501B Units. These capital parts included turbine blades and vanes, specialty tooling, and interstage seals. These components were placed into EPE's inventory for use during the next scheduled outage or forced outage. This occurred

during 2020 when the components were installed in Newman Unit 4 GT1 and GT2. The components were purchased to replace parts that were at the end of the usable life due to service hours beyond the OEW recommended replacement interval. Having these turbine components available to be used on any of the three 501B units is prudent and beneficial to EPE'S customers because it mitigates company risk due to long lead times during high peak demand. These critical components strengthen the availability of EPE's local generation fleet and were purchased in accordance with EPE's procurement policy.

13. PROJECT NO. 13: NEWMAN UNIT 2 DISTRIBUTIVE CONTROL SYSTEM UPGRADE (440 REPORT NO. 91)

Q72. THE THIRTEENTH PROJECT IN YOUR LARGE CAPITAL ADDITIONS TABLE ABOVE IS THE NEWMAN UNIT 2 DISTRIBUTED CONTROL SYSTEM UPGRADE PROJECT. WHAT WAS THIS PROJECT AND WHY WAS IT UNDERTAKEN?

A. A Distributed Control System ("DCS") is an electronic, centralized system used to interface, protect, monitor and control the functions of a power generation unit. The Control Room Operators use the DCS to start and stop units as well as control temperatures, speeds, and flowrates to achieve the desired output. The Newman Unit 2 DCS Upgrade Project was undertaken due to a high failure rate on the previous control system which had become obsolete and very difficult to operate

and maintain without the necessary vendor support and associated replacement parts. The Ovation upgrade replaced all system controllers and field mounted components and included updating the Burner Management System to meet current NFPA 80 codes.

Q73. DID EPE FILE AN AMENDED 440 FOR THIS PROJECT?

A. Yes. The project exceeded the estimated amount by approximately $1.8 million ($0.4 million New Mexico jurisdictional) which accounted for a 37% variance from the original estimate filed in the initial 440 report. The primary factor contributing to the increased cost was the outdated control system; necessary parts had been discontinued, and the previous vendor was acquired by another company. Updating the system to meet current standards resulted in a longer lead time. Additionally, the upgrade required comprehensive training for our operators, as the new system represented a complete overhaul. The amended cost of the project was necessary and reasonable given the scope of the work required to be performed.

14. PROJECT NO. 14: NEWMAN UNIT 4 GAS TURBINE 2 – 2ND SPARE ROTOR (440 REPORT NO. 99)

Q74. THE FOURTEENTH PROJECT IN YOUR LARGE CAPITAL ADDITIONS TABLE ABOVE IS THE NEWMAN UNIT 4 GAS TURBINE 2 – 2ND SPARE ROTOR ACQUIRE PROJECT. WHAT WAS THIS PROJECT AND WHY

WAS IT UNDERTAKEN?

A. The Company purchased a new rotor for Newman Unit 4 GT-2 to replace the existing rotor to re-establish safe and reliable operation and performance due to the original rotor having significantly exceeded its recommended run hours by the OEM by approximately 200,000 hours. The OEM recommends 100,000 run hours for this particular type of rotor in this particular type of turbine. This unit had been operating for over 300,000 hours without refurbishing or replacement of the rotor. Note that the title of this project incorrectly implies that a second spare rotor was purchased. For clarification, this project was to purchase only one new rotor for Newman Unit 4 GT-2. The new rotor was used in Project No. 5, the Newman Unit 4 Gas Turbine 2 Spare Turbine Components project.

Q75. DID EPE FILE AN AMENDED 440 FOR THIS PROJECT?

A. Yes, this project is included in the 440 Amended Report No. 99. For a comprehensive explanation and total variances, please refer to the response for question number 56.

15. PROJECT NO. 15: NEWMAN UNIT 4 GAS TURBINE 1 MAJOR INSPECTION (440 REPORT NO. 98)

Q76. THE FIFTEENTH PROJECT LISTED IN YOUR LARGE CAPITAL ADDITIONS TABLE ABOVE IS THE NEWMAN UNIT 4 GAS TURBINE 1

MAJOR INSPECTION – CAPITAL IMPROVEMENTS PROJECT. WHAT WAS THIS PROJECT AND WHY WAS IT UNDERTAKEN?

A. The Newman Unit 4 Gas Turbine 1 ("GT-1") Major Inspection Project was undertaken to install the new turbine rotor and components from the Unit 4 GT-1 Spare Bladed Rotor Project noted above under Project No. 4. During inspection of the unit, it was determined that the generator required additional maintenance. The work was added to the ongoing outage to maintain safe, efficient and reliable operation of the unit and prevent unplanned outage time in the future. The additional work included repairs to the turbine lubricating oil system and an oil flush to remove impurities from the lubricating oil lines; repairs to various generator components such as the radial lead seals, stator, lead skid, and exciter, along with the associated tests and analyses; and additional labor and subcontractor support to complete this work during the outage.

Q77. DID EPE FILE AN AMENDED 440 FOR THIS PROJECT?

A. Yes, this project is included in the 440 Amended Report No. 98. For a comprehensive explanation and total variances, please refer to the response for question number 54.

/

/

/

16. PROJECT NO. 16: NEWMAN UNIT 4 GAS TURBINE 1-SPARE BLADED ROTOR (440 REPORT NO. 98)

Q78. THE SIXTEENTH PROJECT IN YOUR LARGE CAPITAL ADDITIONS TABLE ABOVE IS THE NEWMAN UNIT 4 GAS TURBINE 1– 501B SPARE BLADED ROTOR PROJECT. WHAT WAS THIS PROJECT AND WHY WAS IT UNDERTAKEN?

A. Similar to the Newman Unit 4 GT-2 project above, the Company purchased a new rotor for Newman Unit 4 GT-1 to replace the existing rotor to re-establish safe and reliable operation and performance due to the original rotor having significantly exceeded its OEM-recommended run hours. The OEM recommends 100,000 run hours for this particular type of rotor in this particular type of turbine. This unit had been operating for over 300,000 hours without refurbishing or replacement of the rotor.

Q79. DID EPE FILE AN AMENDED 440 FOR THIS PROJECT?

A. Yes, this project is included in the 440 Amended Report No. 98. For a comprehensive explanation and total variances, please refer to the response for question number 54.

/

/

/

17. PROJECT NO. 17: MONTANA POWER STATION WAREHOUSE AND ACCESS ROAD

Q80. THE SEVENTEENTH PROJECT LISTED IN YOUR LARGE CAPITAL ADDITIONS TABLE ABOVE IS THE MPS WAREHOUSE AND ACCESS ROAD. WHAT WAS THIS PROJECT AND WHY WAS IT UNDERTAKEN?

A. El Paso Electric entered into a Multi-Year Service Agreement with General Electric (GE) whereby GE is required to provide services necessary to perform covered maintenance of the LMS100 fleet. As part of the obligations of that agreement, EPE must keep an updated spare parts inventory and an area to perform maintenance on the turbine supercore, as well as to store the spare supercore, and other large equipment is also required. An adequate area to perform the maintenance was included in the Warehouse space. The access road was necessary to enable moving the turbine supercore to and from the units. The onsite Warehouse and Maintenance spaces enables work to be performed on site instead of shipping the components to GE service depots.

18. PROJECT NO. 18: NEWMAN UNIT 4 GAS TURBINE 2 MAJOR INSPECTION (440 REPORT NO. 99)

Q81. THE EIGHTEENTH PROJECT LISTED IN YOUR LARGE CAPITAL ADDITIONS TABLE ABOVE IS THE NEWMAN UNIT 4 GAS TURBINE 2

MAJOR INSPECTION – CAPITAL IMPROVEMENTS PROJECT. WHAT WAS THIS PROJECT AND WHY WAS IT UNDERTAKEN?

A. The Newman Unit 4 GT-2 Major Inspection Project was undertaken to install the new turbine rotor and components from the Unit 4 GT-2 Spare Bladed Rotor Project noted above. During inspection of the unit, it was determined that the generator required additional maintenance. The work was added to the ongoing outage to maintain safe, efficient and reliable operation of the unit and prevent unplanned outage time in the future The additional work included repairs to the turbine lubricating oil system and an oil flush to remove impurities from the lubricating oil lines; repairs to various generator components such as the radial lead seals, stator, lead skid, and exciter, along with the associated tests and analyses; and additional labor and subcontractor support to complete this work during the outage.

Q82. DID EPE FILE AN AMENDED 440 FOR THIS PROJECT?

A. Yes, this project is included in the 440 Amended Report No. 99. For a comprehensive explanation and total variances, please refer to the response for question number 56.

/

/

/

19. PROJECT NO. 19: NEWMAN UNIT 3 AIR PREHEATER ROTOR REPLACEMENT

Q83. THE NINETEENTH PROJECT LISTED IN YOUR LARGE CAPITAL ADDITIONS TABLE ABOVE IS THE NEWMAN UNIT 3 AIR PREHEATER ROTOR REPLACEMENT PROJECT. WHAT WAS THIS PROJECT AND WHY WAS IT UNDERTAKEN?

A. The Newman Unit 3 Air Preheater Rotor Replacement Project was undertaken to restore the air preheater on the Newman Unit 3 boiler to its designed condition. Air preheaters are typically installed in boilers on conventional steam power generating units to improve efficiency of the combustion process. In this case, the preheater rotor tube, which is a hollow shaft, had cracked, causing it to bind and stop. Tube replacement required complete disassembly of the equipment. The preheater was rebuilt and reinstalled as new to include heating elements, seals, bearings, gears, and other miscellaneous parts and components.

20. PROJECT NO. 20: COPPER HOT GAS PATH INSPECTION PROJECT

Q84. THE LAST PROJECT LISTED IN YOUR LARGE CAPITAL ADDITIONS TABLE ABOVE IS THE COPPER HOT GAS PATH IMPROVEMENTS. WHAT WAS THIS PROJECT AND WHY WAS IT UNDERTAKEN?

A. The Copper Hot Gas Path Inspection Project expanded into a major overhaul of the GE 7EA to resolve critical reliability concerns and ensure sustained full-load operations. The GE 7EA is a large, utility-class industrial gas turbine that serves

as a critical production asset. Because the turbine represents a single-point-of failure for unit output, degradation of hot gas path and rotating components directly increases the risk of forced outages, capacity loss, and unplanned capital exposure. The primary purpose of this project was to restore the unit's performance and reliability. All 17 compressor rows were replaced, this also included new inlet guide vanes which were replaced using new blades. The turbine section received new R1 blades, new R1 vanes, new combustion baskets, cross-flame tubes, and a new rotor air-cooling pipe. Remaining combustion and turbine components underwent comprehensive repairs and recoating to ensure they were returned to optimal operating condition. In addition to these major component replacements, the outage also included several casing leak repairs and other corrective scopes that had previously limited unit performance and reliability. Collectively, these actions were essential to restoring the unit's output capability, ensuring operational integrity, and supporting dependable service for customers. This project and the overhaul restored OEM compliance, strengthened unit integrity, and mitigated failure risks. This proactive approach improves long-term reliability, supports safe operations, and protects production capacity by minimizing the likelihood of unplanned outages.

Q85. WERE THERE ANY AMENDED 440 REPORTS THAT ARE NOT INCLUDED IN THE ABOVE CAPITAL ADDITIONS TABLE JMH-4?

A. Yes. There was an amendment to Rule 440 Report No. 94 concerning the Rio Grande Unit 8 Boiler Repair Project. The original estimated cost was $2.1 million; however, during the course of the project it was determined that additional boiler tubing was needed to prevent pitting in certain sections that had not been identified in the initial estimate. This resulted in a variance of approximately 28%, with the actual project cost totaling around $2.7 million ($0.6 million New Mexico jurisdictional).

Q86. PLEASE DESCRIBE THE REMAINDER OF THE LOCAL FLEET STEAM PRODUCTION AND OTHER PRODUCTION PROJECTS LISTED ON YOUR CAPITAL ADDITIONS EXHIBIT THAT TOTAL $160.6 MILLION ($31.1 MILLION NEW MEXICO JURISDICTIONAL ADDITIONS).

A. The remaining local fleet Steam Production and Other Production projects are listed on Exhibit JMH-5 with a brief description of each project and cost category.

Q87. CAN YOU DESCRIBE THE COST CATEGORIES FOR THE REMAINDER OF THE LOCAL FLEET PROJECTS?

A. Capital projects are organized into the following three broad categories as discussed below, which are used for management oversight of the projects in the budget.

1. QUALITY ENHANCEMENT – These projects are expected to enhance the quality of the Company's systems and assets, but not necessarily reliability.

2. SYSTEM RELIABILITY AND IMPROVEMENT – These projects are identified as critical to maintain the performance and/or reliability of the Company's infrastructure, generating facilities, computer system and other assets necessary for the reliable operation of the electrical system.

3. The "OTHER" category represents projects under $1 million and includes smaller projects which are not categorized above. These projects include smaller plant improvements and upgrades, capital spare parts procurement, and equipment replacement. Examples of these smaller plant improvements include relay and synchronizer upgrades, boiler drum instrumentation improvements, and instrument air compressor replacements.

Q88. WHAT ARE THE COSTS BY CATEGORY OF THE REMAINDER OF THE LOCAL FLEET PROJECTS?

A. Costs by category are outlined in Table JMH-4 below:

/

/

/

/

/

/

TABLE JMH-4

CATEGORY	TOTAL COMPANY ADDITIONS	NEW MEXICO JURISDICTIONAL ADDITIONS
OTHER TOTAL	$40,790,936	$8,225,011
QUALITY ENHANCEMENT TOTAL	$15,989,338	$3,271,693
SYSTEM RELIABILITY & IMPROVEMENT TOTAL	$103,726,456	$19,572,943
ADJUSTMENTS TO TOTAL COMPANY	$94,534	$0
GRAND TOTAL	$160,601,263	$31,069,646

Q89. WERE THE COSTS FOR THE PROJECTS MENTIONED ABOVE REASONABLE AND NECESSARY?

A. Yes, these costs were reasonable and necessary for EPE to continue to provide safe, efficient and reliable service with EPE's local generation fleet. Projects in the categories listed in Table JMH-4 were thoroughly evaluated by management before being considered for budget approval and are the result of reasonable management decisions.

Q90. ARE ALL OF EPE'S CAPITAL ADDITIONS THAT WERE INCLUDED AND CLOSED TO PLANT AFTER JANUARY 1, 2020 THROUGH OCTOBER 31, 2025 USED AND USEFUL TO THE LOCAL GENERATION FLEET?

A. Yes, they are. These projects were undertaken after review and challenges by

management for alignment with EPE's strategy and objectives to provide safe, reliable and efficient generation at reasonable costs.

C. TEST YEAR PERIOD ADJUSTMENTS

Q91. DID EPE MAKE ANY TEST YEAR PERIOD ADJUSTMENTS FOR NON-FUEL O&M AND RATE BASE COSTS FOR EPE'S LOCAL GENERATING UNITS?

A. Yes. EPE witnesses Sierra and Prieto present three specific adjustments to non-fuel O&M costs and rate base for the local units. First, EPE adjusts payroll expenses for all employees to reflect increases in salary levels and related benefits during the Base Period and per the union contract. This total Company adjustment of approximately $4.2 million ($1.0 million New Mexico jurisdictional basis) includes an adjustment for payroll expenses for generation employees. The second adjustment was made to total Company Property Insurance expense to reflect the reduction in current premiums for insurance policies in the amount of $304,622 ($65,357 New Mexico jurisdictional basis). The third adjustment removes the non-labor O&M expenses for Rio Grande Unit 6, as agreed to in the 2015 Rate Case (Case No. 15-00127-UT), in the amount of $349,818 ($84,621 New Mexico jurisdictional basis).

VI. CONCLUSION

Q92. ARE THE CAPITAL INVESTMENTS THAT EPE IS REQUESTING BE INCLUDED IN RATE BASE FOR GENERATION PLANT AND THE EMS REASONABLE?

A. Yes. My testimony demonstrates that these investments were prudently incurred, are reasonable, and being used to provide safe and reliable service.

Q93. ARE THE O&M EXPENSES THAT EPE PROPOSES TO RECOVER THROUGH ITS BASE RATES FOR OPERATION OF ITS GENERATION REASONABLE?

A. Yes. My testimony shows that these are reasonable and necessary expenses for the provision of safe and reliable service to EPE's New Mexico customers.

Q94. DOES THIS CONCLUDE YOUR TESTIMONY?

A. Yes, it does.

BURNS McDONNELL

August 15, 2023

Jeff Hughes
Plant Manager - Newman / Rio Grande Newman Power Station
PO Box 982
El Paso Texas, 79960

Re: Newman Unit 3 – June 28 Summary of Events

Dear Mr. Hughes:

On June 28, 2023, El Paso Electric Newman Unit 3 experienced a fire. Dan Leeper, already on route to El Paso for another purpose, was contacted and arrived on site the afternoon of June 28. This report attempts to summarize information gathered from the plant's distributed control system (DCS) and from plant staff to summarize the events preceding the fire. Times are subject to the DCS and other equipment HMI refresh scan rates for the associated points.

Summary of Events – June 26

On 6/26/23 at 13:31:53 the DC Battery circuit breaker indicates that it opens per the alarm history log on the battery charger local HMI. DC voltage measured at the DCS

Figure 1

prior to the breaker opening was ~130V. The batteries can no longer be charged with this breaker open and battery voltage decreases as the battery discharges. Figure 1 shows the status of the battery charger HMI on the day of the event. As a note, there appears to be approximately a 10-minute discrepancy between the DCS and the battery charger HMI. The initiating event causing the Battery Circuit Breaker to open is not clear from the data available to BMcD.

The Emergency Bearing and Seal Oil Pump was running on 6/26/23. Bearing and

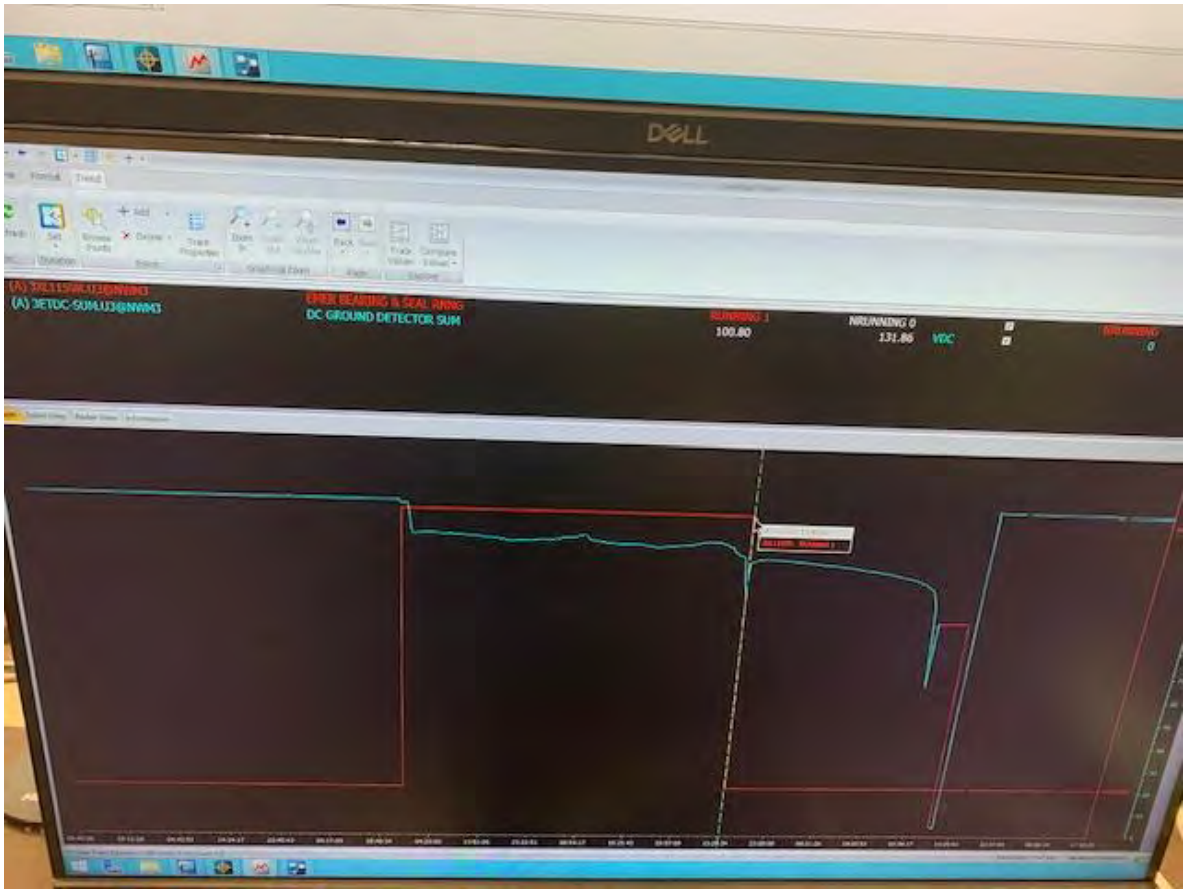

Figure 2

Seal Oil Pumps provide oil to the turbine and generator bearings and provide sealing

oil to keep the hydrogen used to cool the generator from escaping. The Emergency

Figure 3

Bearing and Seal Oil Pump nameplate indicates the motor draws 158 amps. Under normal conditions, the seal oil is supplied from 480V AC pumps fed from the plant's auxiliary power system. Under emergency situations when the AC power system is not available, a 120V DC pump called the Emergency Bearing and Seal Oil Pump is used to maintain oil to the bearings and seals. The Emergency Bearing and Seal Oil Pump is reported by the plant to be run routinely to verify its operation.

BURNS McDONNELL

Figure 4

was annunciated on the DCS at 13:41:30. This alarm is initiated when DC voltage reads below 100 Volts.

The voltage continued to decline, dropping to around 95.96 volts DC as measured in the DCS at 6/26/23 at 13:47:38.216, around the same time the Emergency Bearing and Seal Oil Pump stopped. It is not clear from the trends if the pump was manually stopped or if the pump protective overloads tripped due to the low DC voltage. The

Figure 5

DC voltage increased after the Emergency Bearing and Seal Oil Pump stopped as shown in Figure 5, but from there once again began to decrease as shown in Figure 2.

Summary of Events – June 28

On 6/27/23 at 23:37:17 an alarm (DC GROUND DETECTOR) was annunciated indicating an issue with the readings on the DC power supply, followed up by another alarm (DC GROUND DETECTOR SUM) on 6/28/23 at 00:41:16 which indicated DC voltage is less than 100V. The alarm was cleared, however the code in the alarm list indicates that the alarm was "shelved" and removed from the alarm screen without

Figure 6

the condition being resolved. Approximately one hour later, at 01:41:30, an alarm annunciated, indicating the AVR HMI power supply failed. Within minutes, the primary and redundant AVR controllers went into alarm and the AVR firing circuit power supply indicated a failure on the alarm screen. Figure 6 was generated from an export of the alarm historian, showing the alarms between 6/27/23 at 23:25 and 6/28/23 at 01:45.

At approximately 6/28/23 01:59:58, the MW demand on the unit is increased. The generator voltage drops and generator current increases. At 6/28/23 01:59:58.625 the Automatic Voltage Regulator (AVR) field voltage drops from 196.2 to 0 immediately. Within seconds, communication signals from the AVR to the DCS begin to show a "T" next to the signal value indicating "Timeout." This means the DCS cannot communicate with the device to retrieve the value.
At 6/28/23 02:00:02.114 both Generator relays 87GP and 87GB trip on the loss of generator field element 40Z2T. Both Generator circuit breakers (GCB) 8186B and 7216B open around 02:00:02.500.

The main medium voltage breaker, NSST, opens at 02:00:02.933. Under normal conditions, a protective trip of the Generator relays will initiate a transfer from NSST to the reserve medium voltage main breaker, RSST. During this event, the RSST breaker did not close, so power to the AC systems was not restored after the opening of the NSST breaker. Transfer to the RSST was not being blocked by the DCS. The following happened in rapid succession:

- Bearing and Seal Oil Pump A indicates as stopped (not running) at 2:00:03.425.
- Bearing and Seal Oil Pump B did not indicate running. The pump did not start as expected, despite the presence of an auto transfer switch that also accepts power from Unit 2.
- The Emergency Bearing and Seal Oil Pump does not indicate a start occurred at the DCS (It was noted that the Emergency Bearing and Seal Oil Pump was not in Auto at the DCS).
- Oil pressure in the bearings decreases as the turbine spins down (See trends in the appendix). Withing 15 seconds the bearing oil pressure decreases to less than 2PSIG.

Once the generator breaker opened, the steam turbine initially increased speed and peaked at ~3746 RPMs. As the steam turbine came down in speed, each bearing peaked at a high number and then went to zero indicating the probe was no longer reliably measuring vibration. Table 1 is a summary of the record. The turbine coasted

Probe	Time of signal loss	Speed	Peak Vibration recorded
BEARING 1X VIBRATION	2:00:21	3613.3	11.248

Page 8

No signal for generator hydrogen pressure was identified in the DCS, therefore no conclusion can be drawn regarding exactly when the generator depressurized, however the H2 purity begins to decay immediately after the GCB opens.

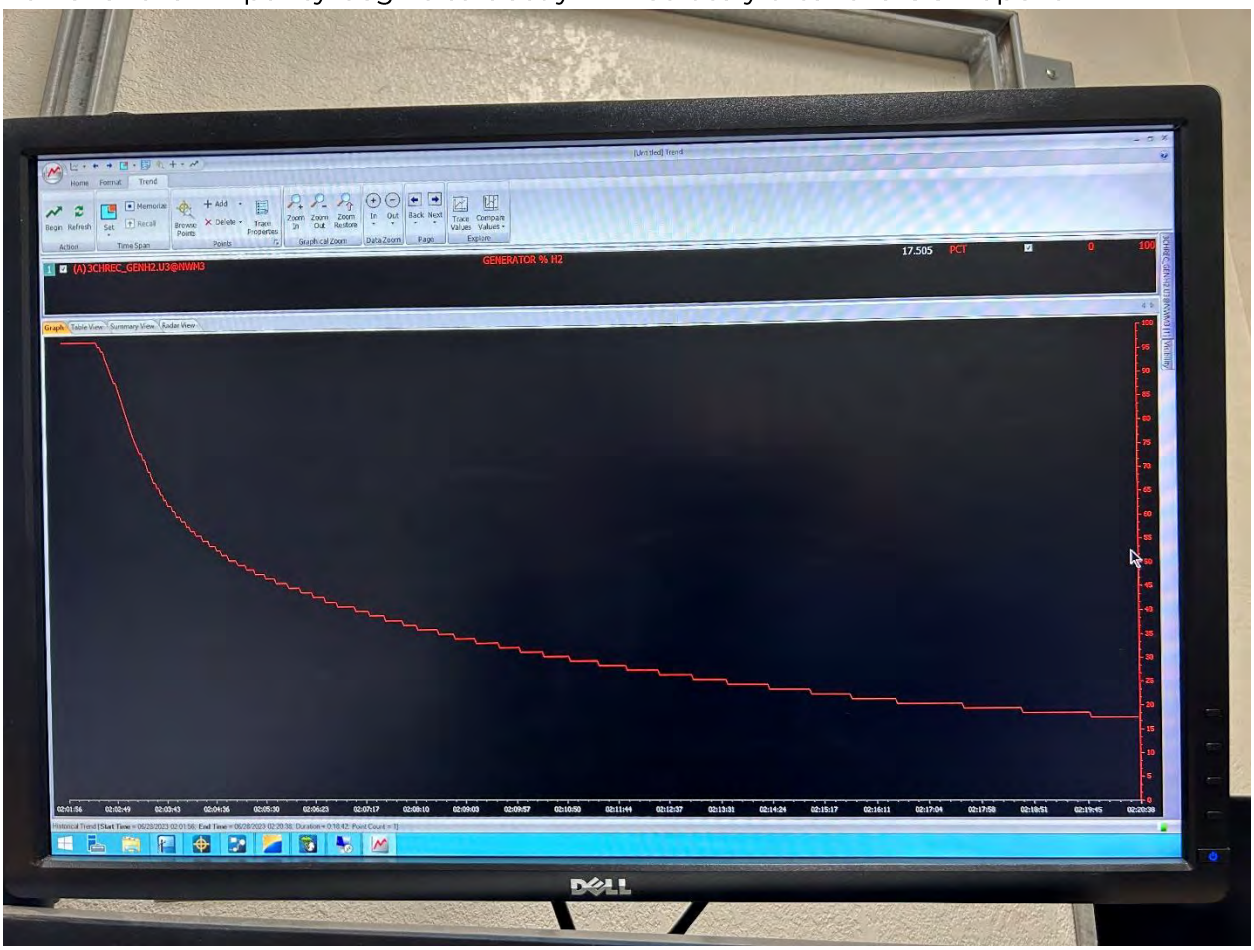

Figure 7

If any questions arise regarding the findings of this report, please feel free to contact Dan Leeper at (816) 822-3996 or Craig Reschke at (816) 782-6164.

Sincerely,

Dan Leeper

DECLARATION OF JEFFERY M. HUGHES IN SUPPORT OF THE FOREGOING DIRECT TESTIMONY TO THE APPLICATION OF EL PASO ELECTRIC COMPANY FOR REVISION OF ITS RETAIL ELECTRIC RATES PURSUANT TO ADVICE NOTICE NO. 317

I, ***Jeffery M. Hughes***, pursuant to Rule 1-011 NMRA, state as follows:

1. I affirm in writing under penalty of perjury under the laws of the State of New Mexico that the following statements are true and correct.

2. I am over 18 years of age and have personal knowledge of the facts stated herein. I am employed by El Paso Electric Company ("EPE" or "the Company") as the *Newman Power Plant Manager*.

3. The foregoing Direct Testimony of Jeffery M. Hughes, together with all exhibits sponsored therein and attached thereto, is true and accurate based on my knowledge and belief.

4. I submit this Declaration, based upon my personal knowledge and upon information and belief, in support of EPE's ***Application for Revision of Its Retail Electric Rates Pursuant to Advice Notice No. 317.***

FURTHER, DECLARANT SAYETH NAUGHT.

I declare under penalty of perjury that the foregoing is true and correct.

Executed on March 27, 2026.

/s/ Jeffery M. Hughes

EL PASO ELECTRIC COMPANY
DIRECT TESTIMONY OF
OMAR A. GALLEGOS

I. INTRODUCTION AND QUALIFICATIONS

Q1. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Omar A. Gallegos. My business address is 100 N. Stanton Street, El Paso, Texas, 79901.

Q2. BY WHOM AND IN WHAT CAPACITY ARE YOU EMPLOYED?

A. I am employed by El Paso Electric Company ("EPE" or the "Company") as Vice President of Energy Delivery.

Q3. PLEASE DESCRIBE YOUR PRINCIPAL AREAS OF RESPONSIBILITY.

A. As Vice President of Energy Delivery, I am responsible for the oversight and direction of EPE's Energy Delivery Division. The Energy Delivery Division is, essentially, the Transmission and Distribution ("T&D") "wires" portion of EPE, which includes the Transmission, Substations and Relays ("TSR"), Distribution System Engineering, Distribution Operations, TSR Construction and Maintenance, Meter Test, and Project Management subdivisions. I also am responsible for ensuring that each of these systems operate in a safe and reliable manner to collectively provide T&D service to EPE customers.

EPE's T&D Departments were restructured in 2025 to more efficiently and effectively meet the needs and challenges of an expanding electric energy delivery

system. The drivers for reorganization were to effectively address four over-arching priorities: (1) capital project execution for grid growth needs, (2) proper attention to distribution customer service requests considering supply chain challenges, (3) T&D grid modernization, and (4) customer transmission level service requests. The drivers for reorganization were to effectively address four over-arching priorities: (1) capital project execution for grid growth needs, (2) proper attention to distribution customer service requests considering supply chain challenges, (3) T&D grid modernization, and (4) customer transmission-level service requests. Prior to that reorganization, my responsibilities as VP of Energy Delivery included oversight of EPE's Transmission System Planning (2022-2023), Distribution Design for new customer connections, and Distribution Construction and Maintenance (2022-2024).

Q4. PLEASE SUMMARIZE YOUR BUSINESS AND EDUCATION BACKGROUND.

A. I have been employed by EPE since 2009. I have served in my current role as Vice President of Energy Delivery since 2022. Prior to becoming a Vice President, I served as Director of Resource Planning and was responsible for the Integrated Resource Plan and new energy resource selection (2017-2021). My early career at EPE included roles in System Operations, Corporate Projects and T&D Project

Management and Budgeting.

I hold a Bachelor of Science degree in Mechanical Engineering and a Master's degree in Business Administration, both from University of Texas at El Paso. I also obtained a Graduate Certificate for Public Utility Regulation and Economics from New Mexico State University.

Q5. HAVE YOU PREVIOUSLY PRESENTED TESTIMONY BEFORE REGULATORY AGENCIES?

A. Yes. I have previously presented testimony before the New Mexico Public Regulation Commission ("NMPRC" or "Commission") as well as the Public Utility Commission of Texas.

II. PURPOSE OF TESTIMONY

Q6. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. The purpose of my testimony is to support the necessary and reasonable costs to provide safe and reliable T&D service to EPE's customers. My testimony addresses the following topics:

- EPE's T&D system;
- Organization and responsibilities of EPE's Energy Delivery Department;
- How EPE plans and operates its T&D system;

- The reasonableness of EPE's T&D capital investments placed in service since EPE's last rate case, NMPRC Case No. 20-00104-UT ("2020 Rate Case"), including (1) Test Year Period adjustments for T&D plant placed in service during October 2025 and (2) legacy meters that were installed between January 1, 2020 and December 31, 2023 and then replaced by advanced meters pursuant to Commission Case No. 21-00269-UT Final Order authorizing EPE's Grid Mod plan for deployment of an advanced metering system ("AMS");21-00269-UT Final Order authorizing EPE's Grid Modernization plan for deployment of an advanced metering system ("AMS");
- The reasonableness of T&D operation and maintenance ("O&M") costs; and
- EPE's proposed replacement Rule No. 8 – Line Extension Policy and corresponding changes to Rule No. 13 – Increase or Decrease of Connected Load.

Q7. WHAT RATE CASE SCHEDULES DO YOU SPONSOR?

A. I sponsor Schedules P-8 and P-10.

Q8. PLEASE PROVIDE A BRIEF SUMMARY OF YOUR TESTIMONY.

A. EPE is requesting $251,472,746 of total Company transmission plant additions since the 2020 Rate Case through the Base Period ending September 30, 2025, as

adjusted for the Test Year Period. This amount includes $660,877 of total Company transmission plant placed into service between October 1, 2025, and October 31, 2025. EPE witness Adrian Hernandez supports the allocation of New Mexico jurisdictional transmission plant additions in the amount of $55,592,040.

The Company is also requesting $197,344,455 in direct assigned New Mexico distribution plant additions since the 2020 Rate Case through the Base Period ending September 30, 2025, as adjusted for the Test Year Period. The Company is also requesting $197,344,455 in direct-assigned New Mexico distribution plant additions since the 2020 Rate Case through the Base Period ending September 30, 2025, as adjusted for the Test Year Period. This request includes $12,642,824 for New Mexico distribution plant placed into service between October 1, 2025, and October 31, 2025.

O&M expense for transmission on a total Company basis is $29,603,190. EPE witness Hernandez supports the New Mexico jurisdictional transmission O&M in the amount of $6,872,008. The New Mexico direct-assigned O&M expense for distribution is $8,240,915.

My testimony demonstrates that the costs of EPE's T&D plant additions are reasonable and necessary and used and useful, for safe, reliable and efficient service to New Mexico customers. It also demonstrates that the Test Year Period expenses for T&D are reasonable and necessary for safe and reliable service to New Mexico

customers. I also support the reasonable and necessary costs of investment in legacy meters installed between January 1, 2020 and December 31, 2023 that were then replaced during AMS deployment. I also support the reasonable and necessary costs of investment in legacy meters installed between January 1, 2020, and December 31, 2023, that were then replaced during AMS deployment. Additionally, I address any Rule 440 reports that needed to be amended for transmission or distribution projects. I conclude my testimony with EPE's proposed replacement Line Extension Policy.

EPE witnesses Steven A. Sierra and Cynthia S. Prieto address Test Year Period adjustments to capital investments and operating costs.

Q9. WHAT ARE THE PRIMARY DRIVERS FOR CAPITAL INVESTMENTS IN T&D?

A. There are three primary drivers of T&D capital investments. I briefly describe them here at a high level and offer more project-specific details later in my testimony. First, organic load growth, including urban sprawl and increased usage from electrification, requires system expansion, upgrades to existing infrastructure, and customer connections.

The second driver is upgrades associated with the interconnection of energy resources, inclusive of New Mexico renewable resources for New Mexico

Renewable Energy Act ("REA") compliance. Transmission upgrades associated with interconnections at the transmission level are defined per EPE's Federal Energy Regulatory Commission ("FERC") open access transmission tariff ("OATT").

The third driver is reliability investments, with the largest being investments associated with wildfire mitigation. This category also includes technology and grid enhancements of transmission-level protection and control and distribution-level remote controllable recloser segmentation for outage mitigation and restoration.

III. OVERVIEW OF T&D SYSTEM

Q10. HOW IS THIS SECTION OF YOUR TESTIMONY ORGANIZED AND WHAT DOES IT DESCRIBE?

A. This section first provides a high-level description of the role T&D plays in delivering power to EPE's New Mexico customers. I then describe EPE's T&D systems, including significant changes that are necessary to meet EPE's dual obligations to provide safe and reliable electric service while also satisfying EPE's incremental renewable portfolio standard ("RPS") targets set by the REA.

Q11. PLEASE DESCRIBE THE ROLE OF T&D INFRASTRUCTURE IN DELIVERING POWER TO EPE'S RETAIL CUSTOMERS.

A. The function of the T&D system is to interconnect energy generation resources and transmission lines to deliver power to retail customers. The T&D system is a complex, networked grid that operates at multiple voltages and interconnects multiple energy resource types at various locations and voltages. Substations are the facilities that enable interconnection of resources, networking of transmission lines, reactive power equipment, and stepping up and down of system voltage. Collectively, the energy generation resources and transmission grid comprise the Bulk Electric System ("BES"). The BES is critical to maintain reliability and grid stability. An important role of the BES is the tie-lines interconnecting the EPE system to the neighboring systems and the Western Interconnection, overall, which provides stability to the grid and broad access to the interconnected network to import power for both reliability and optimization of market opportunities.

EPE manages its portion of the grid and the dispatch of resources connected to it for both cost optimization and grid stability and reliability. Without the BES, EPE could not meet the service obligations it has to retail customers, because it is through the BES network that resources are integrated into it for ultimate consumption by end users. The BES is the system which enables the distribution facilities to function. Because so few of EPE's customers receive power directly

from facilities that operate at a transmission voltage, retail customers rely upon the transmission network to move power into the distribution system and then into the many dispersed neighborhoods, homes and businesses that are connected to it. The BES includes EPE's transmission facilities that operate at voltages of 115 kV, 345 kV and 500 kV. The BES receives resources into it, integrates those resources, and then supports the functioning and reliability of the interconnected distribution system which allows power to be received and consumed by EPE retail customers.

Q12. PLEASE DESCRIBE EPE'S 345 KILOVOLT ("kV") AND 500 kV TRANSMISSION FACILITIES.

A. The North American Bulk Electric System is comprised of three independent electrical grids: the Western Interconnection, the Eastern Interconnection, and the Electric Reliability Council of Texas ("ERCOT"). EPE is a member of the Western Electricity Coordinating Council ("WECC") and is located in the far southeast corner of the Western Interconnection, often referred to as the Western Grid. The WECC region spans a geographic area that, starting with EPE's west Texas service territory, extends north to include two Canadian provinces and extends west to cover all or part of 14 western states and northern Baja California, Mexico.

To the east, EPE is connected to the Eastern Interconnection through an asynchronous High Voltage Direct Current ("HVDC") tie located at the Eddy

County Substation near Artesia, New Mexico. The Southwest Power Pool ("SPP") is on the eastern side of the Eddy County HVDC tie. EPE is not interconnected with the Electric Reliability Council of Texas. Overall, EPE owns approximately 989 miles of multiple 345 kV transmission lines, most of which are situated within New Mexico. A copy of the WECC System Map is attached to this testimony as Exhibit OAG-1.

Q13. WHAT IS THE FUNCTION OF THESE TRANSMISSION FACILITIES?

A. EPE's 345 kV transmission facilities connect Las Cruces, New Mexico, and El Paso, Texas (and surrounding communities) to the Western Interconnection and connect the EPE system to the Eastern Interconnection. A copy of the Southwest Area Extra High Voltage Transmission map of the WECC System, which shows EPE's service territory, is attached to this testimony as Exhibit OAG-2.

EPE's major 345 kV transmission interconnections with other utilities include: (1) the West Mesa Switching Station near Albuquerque, New Mexico, with the Public Service Company of New Mexico ("PNM"); (2) the Eddy County HVDC Terminal near Artesia in Eddy County, New Mexico, with Southwestern Public Service Company ("SPS"); and (3) the Springerville Generating Station and Greenlee Substation (both located in Arizona) with Tucson Electric Power Company ("TEP"). Additionally, EPE has a partial ownership interest in three 500

kV transmission lines in Arizona that are connected to the Palo Verde Generating Station ("Palo Verde") and extend from switchyards at Palo Verde to the Kyrene and Westwing substations in Maricopa County, just outside of Phoenix, Arizona. These 500 kV transmission facilities in Arizona are integrated into the EPE transmission network and are part of the network that allows for the Palo Verde resources to be relied upon by EPE retail customers.

Q14. PLEASE DESCRIBE EPE'S OTHER HIGH VOLTAGE TRANSMISSION FACILITIES.

A. EPE also owns and operates highly networked 115 kV and 69 kV lines in and around Las Cruces, New Mexico and El Paso, Texas. This high level of networking increases the reliability of the system by allowing power to re-route to other locations within the interconnected transmission network during outages. A map showing EPE's transmission system is attached to this testimony as Exhibit OAG-3. EPE's 115 kV transmission facilities are part of the BES.

Q15. WHAT ROLE DO THE 115KV TRANSMISSION FACILITIES PERFORM IN SERVING CUSTOMERS?

A. The 115kV transmission facilities play multiple roles. First, these facilities deliver power to the 69 kV part of the transmission network and to the various distribution substations located throughout the service territory. In New Mexico, distribution

substations are located as far north as Hatch, NM, south to Santa Teresa, NM, and from the Las Cruces Airport to Chaparral, NM west to east. Second, they provide several interconnection points for energy resources to transmit this power on the network and to distribution substations. Finally, the 115 kV transmission works in parallel with the higher voltage portions of the network to permit power resources to be integrated into the network, and to allow the network to integrate customer loads within it. It is through the integrated nature of the transmission network, and the integration of resources and loads within the network, that system reliability and system stability are achieved and maintained.

Q16. PLEASE DESCRIBE HOW EPE'S DISTRIBUTION SYSTEM DELIVERS POWER TO EPE'S RETAIL CUSTOMERS.

A. The distribution system is the customer connection level of an electric utility's energy delivery system. Physically, the distribution system is the collection of electric lines that run down streets and alleys, and to which all homes and businesses are connected. All distribution lines originate at a substation where a transformer reduces (or "transforms") the energy delivered at transmission voltage (i.e., voltages of 69 kV and above) to energy of a lower distribution voltage (i.e., 24 kV and below). The distribution lines coming out of a substation are the distribution circuits or "feeders" that extend through the service area to deliver

electric energy to the customers. The lower distribution level voltage allows for the use of smaller support structures that are easier to construct in populated areas.

The final connection between a home or business and the distribution system is accomplished by yet another transformer (pole-mounted or pad-mounted) that steps down (again, "transforms") the energy delivered at the distribution voltage (24 kV, 14 kV, or 4 kV) to one of the standard service voltages for the home (120/240 Volts) or business (277/480 Volts). The physical connection of the home or business is the point of metering.

The distribution system also facilitates New Mexico's distributed solar generation and community solar interconnections. The first 15 MW of the New Mexico Community Solar Program were interconnected in 2025, and another 15 MW are currently in process for planned interconnection in 2026.

Q17. DOES THE TRANSITION TO RENEWABLE RESOURCES IMPACT T&D SYSTEMS?

A. Yes. There are two significant impacts to T&D systems. First, the transition from traditional power plants to renewable energy and associated battery resources requires more grid interconnections. Traditional gas generation uses large, centralized plants with few interconnections to the grid, whereas generation of

renewable energy typically relies on a diverse portfolio of multiple energy resources with significantly more interconnections.

Second, the advent of distributed energy resources also impacts the complexity of the distribution system. The distribution system was originally designed as single direction power flow from the BES to the customer. The introduction of energy resources on the distribution grid now creates a multi-directional power flow system that impacts equipment ratings and voltage variations that must be managed. This results in equipment upgrades, increased reactive power capacity, increased system monitoring and control capabilities. This includes EPE's upgrades of metering at the New Mexico substations to measure minimum feeder loads for distributed generation hosting capacity. The increase in inverter-based resources is also changing the stability and reactive power requirements of the BES grid. This also includes increased reactive power demands and system monitoring and control. Additionally, it requires strengthening of the transmission grid for resiliency due to the reduction in synchronous generators which contribute to inertia of the system.

Q18. HOW MANY MEGAWATTS OF RENEWABLE SOLAR ENERGY AND BATTERY ENERGY STORAGE SYSTEM ARE INTERCONNECTED TO EPE'S SYSTEM?

A. As of September 2025, EPE has 545 MW of solar energy resources and 125 MW of battery energy storage system ("BESS") interconnected to EPE's system to serve its customers. There are an additional 730 MW of solar resources and 665 MW of BESS planned through 2029 as reflected by the EPE's Commission-accepted 2025 IRP.

Q19. HAVE NEW ENERGY RESOURCES BEEN INTERCONNECTED TO EPE'S SYSTEM SINCE EPE'S 2020 NEW MEXICO RATE CASE?

A. Yes. EPE interconnected and energized seven transmission-level interconnections and one distribution-level interconnection since the last New Mexico rate case. The energy resources (both owned and contracted) are listed in Table OAG-1 below. Additionally, a TEP wind resource, Oso Grande, which wheels through the EPE system to TEP, was interconnected in June 2020. This is referenced later in my testimony addressing project TS142.

IV. T&D ORGANIZATIONAL STRUCTURE

Q20. HOW IS THIS SECTION OF YOUR TESTIMONY ORGANIZED?

A. In this section, I first describe the organization structure of the EPE departments that collectively comprise T&D and the roles and responsibilities of each of those

departments. I next address EPE's ongoing workforce training and other efforts to sustain a workforce pipeline for skills training.

Q21. PLEASE DESCRIBE EPE'S T&D ORGANIZATIONAL STRUCTURE.

A. My background section briefly addresses EPE's reorganization of T&D since EPE's last rate case. EPE has structured the T&D responsibilities to operate efficiently and effectively to meet the needs and challenges of an expanding electric energy delivery system.

Figure OAG-1 below identifies the ten sub departments within T&D by solid green, double border squares. As shown in the figure, these sub departments span across three divisions—Energy Delivery, Energy Supply & Distribution Ops, and System Plan & Operations Support.

Director Support Services
Director Land Management

Q22. WHAT IS THE ROLE OF ENERGY DELIVERY?

A. Energy Delivery focuses on capital project execution for T&D grid growth needs, T&D grid modernization, and transmission permitting and land acquisition. This also includes execution of energy resource interconnections and transmission level customer service connections. The division is also responsible for T&D asset maintenance engineering. Energy Delivery also has the field workforce for transmission, substation, relay and meter test activities.

Q23. WHAT IS THE ROLE OF DISTRIBUTION DESIGN AND OPERATIONS?

A. Distribution Design is the engineering department supporting new distribution level customer connection requests. Distribution Operations is the field workforce for all distribution construction and maintenance activities.

Q24. WHAT IS THE ROLE OF THE SYSTEM PLANNING AND SYSTEM OPERATIONS DEPARTMENTS?

A. System Planning is responsible for developing EPE's Ten-year System Expansion Plan for defining transmission infrastructure requirements to meet customer demand. They are also responsible for the transmission-level generator interconnection requests and agreements per EPE's FERC-approved OATT process. System Operations maintains control of EPE's BES for reliability.

Q25. DOES THE DISTRIBUTION DIVISION HAVE ANY PROGRAMS TO SUPPORT INTEREST IN DISTRIBUTION CAREERS AND OTHER OPPORTUNITIES TO JOIN EPE'S WORKFORCE?

A. Yes, the Distribution Division occasionally participates in, and benefits from, a College Internship Program. This internship program is designed to provide valuable on-the-job experience in one of our corporate divisions and advance the participants' technical, leadership and professional competencies through challenging work projects and training. This unique program allows participants to network with executives and business leaders in the Company; gain electrical utility work experience; and build transferable skills such as problem-solving, teamwork, and effective communication. This paid program recruits rising seniors and graduate students from colleges and universities throughout the country who have a vested interest in the power industry with the goal of returning that talent to Las Cruces, New Mexico, or El Paso, Texas, upon graduation.

Additionally, EPE has partnered with the Doña Ana Community College ("DACC") in its Line-worker Certification Program to promote, train, support, and develop individuals who are interested in a career in the various skilled positions within the electric utility industry. The DACC Line-worker Certification Program includes two semesters of course work with physical and technical field training

followed by a 10-week internship with an electric utility (investor-owned electric utility or a rural electric co-op). EPE, working in conjunction with DACC, recruits eight students to the program each year. EPE also provides tuition scholarships for those qualified and the 10-week internship to finish their certification. The EPE/DACC Line worker Certification Program partnership has been in place for eleven consecutive years and has been tremendously successful in attracting and retaining motivated individuals to EPE's skilled workforce. Most of the students who successfully completed their DACC Line-worker Certification (including their 10-week working internship with EPE) have been hired on to EPE full-time.

EPE has established a similar partnership in its Texas jurisdiction with Western Technical College ("WTC") with the first class starting in May of 2024. WTC is composed of a 12-week, 40-hour per week, course with physical, technical field training followed by a 10-week working internship with an electric utility (investor-owned electric utility or a rural electric co-op). As with the DACC partnership, EPE recruits eight students to the program each year. EPE also provides tuition scholarships for those qualified, and the 10-week internship to finish their certification.

Q26. DOES THE DISTRIBUTION DIVISION PROVIDE ANY ON THE JOB TRAINING FOR THE LINE-WORKER WORKFORCE ONCE THEY JOIN EPE?

A. Yes. Upon joining EPE's line-worker workforce, an individual can join EPE's International Brotherhood of Electrical Workers apprenticeship program. Upon completion of the apprenticeship, the employee will be a full-time lineman. EPE has also completed construction of a new modern training center with advanced media classrooms and fully operational outdoor training yards for crews. EPE also invested in an outdoor distribution training simulator that provides voltage without the hazardous arc flashes and fault currents. Figure OAG-2 shows the new training center and field equipment used for training:

Figure OAG-2

Q27. DOES THE DESCRIBED T&D STRUCTURE AND ORGANIZATION PROVIDE FOR A REASONABLE AND EFFICIENT OPERATION?

A. Yes. EPE is focused on running T&D efficiently while providing safe and reliable service. The departmental organization described above allows T&D to leverage synergies and maximize coordination across T&D. The consolidation of TSR Engineering, Distribution Grid Engineering and Distribution Operators within Energy Delivery allows a focus on the grid optimization efforts and interrelationships between T&D systems.

V. IDENTIFICATION OF T&D PROJECTS AND PROCESSES

Q28. PLEASE DESCRIBE WHAT IS COVERED IN THIS SECTION OF YOUR TESTIMONY.

A. This section first explains how EPE identifies the need for T&D capital projects. I then address EPE's process to manage costs associated with these projects.

A. IDENTIFYING THE NEED FOR TRANSMISSION CAPITAL INVESTMENTS

Q29. HOW DOES EPE IDENTIFY THE NEED FOR TRANSMISSION PROJECTS?

A. The need for transmission infrastructure improvement projects is often identified through EPE's system planning for the expansion of and assessing the continued operational capability of EPE's transmission and substation systems, which consists of EPE's transmission lines, interconnections with neighboring systems, and any studies that may impact the transmission system. The process of system planning is necessary to evaluate and identify the need for facilities to meet present and future load and to comply with the operational requirements mandated by the WECC and NERC Reliability Standards.[1] The output of this process is EPE's annual Ten-year System Expansion Plan.

Q30. HOW DOES EPE IDENTIFY TRANSMISSION UPGRADES AND PROJECTS ASSOCIATED WITH TRANSMISSION SYSTEM GENERATOR INTERCONNECTIONS?

A. Employees in EPE's System Planning department manage generator interconnections to the integrated EPE transmission network. The process by which such generator interconnection requests are made and agreements are executed is governed by EPE's FERC-approved OATT.

[1] Although the NERC Reliability Standards do not apply to 69 kV assets, EPE applies the same reliability standards to its 69 kV system to ensure uniform reliability standards across its system.

Q31. ARE ALL TRANSMISSION PROJECTS IDENTIFIED AND DEFINED THROUGH THE SYSTEM PLANNING EFFORTS DESCRIBED ABOVE?

A. No. The need for some capital projects can also be identified and defined in the regular course of EPE's annual O&M inspections, in response to an unexpected transmission and substation asset contingency event, or both. Often, EPE executes these capital improvement projects immediately upon discovery when restoring the operational service of a transmission and substation asset (e.g., replacing a transmission structure that collapsed under extreme weather conditions to return the line to service). However, some of these "inspection-identified" or "event-caused" replacement or repair projects require more planning or equipment procurement time, or both. EPE's TSR personnel will manage the execution of asset repairs or replacements, usually within one to two years, based on their need.

It is also important to emphasize that some projects are identified and initiated by EPE's TSR or Distribution personnel. These projects are usually driven by customer service requests or public infrastructure projects (e.g., New Mexico Department of Transportation projects) that require additional or relocation of EPE assets.

Q32. WHAT SEVERE WEATHER EVENTS AND RISKS IS EPE'S SYSTEM EXPOSED TO?

A. Extreme weather events in EPE's service territory include high winds, thunderstorms, and extreme heat. EPE witness George Novela describes recent weather trends of increasing temperatures and high heat days. I briefly describe how extreme weather events in EPE's service territory impact EPE's system.

EPE is exposed to high wind events throughout the year, with and without associated storms. In the winter and spring months, sustained winds of 50 to 60 mph and wind gusts of up to 90 mph occur, especially in open areas and mountain passes. These wind speeds are comparable to those in a category 1 hurricane, which can lead to infrastructure damage and outages. Flying debris and vegetation caused by high winds also contribute to outages. From May to September, EPE's service territory also experiences frequent thunderstorm events. A subset of EPE's transmission system is located within the Gila National Forest, which is vulnerable to wildfires, particularly during dry, high temperature periods.

EPE's service territory is also prone to high heat events. Hot weather raises cooling demands across all customer levels, which in turn increases the electrical loading on equipment. EPE's system also faces outages from extreme heat, regardless of precipitation. Extended periods of high temperatures further strain load-serving equipment, which lacks sufficient cooling time. At the BES level, extreme heat can lead to equipment failures due to heat stress and thermal overloading. The North American Electric Reliability Corporation ("NERC")

mandates that utilities operate their transmission systems within capacity ratings. When heat waves push equipment to or beyond these limits, utilities must quickly reduce loads or take equipment offline to prevent failures. Thanks to monitoring systems and NERC standards, such failures are rare.

Q33. HOW DOES EPE PLAN AND DESIGN FOR HIGH WIND AND WILDFIRE EXPOSURE?

A. EPE has updated transmission design standards for new or rebuilt transmission lines. The updated design standards use steel poles and can withstand 100 mph wind loads. Using steel structures also mitigates the risk of wildfire to transmission lines. EPE proactively rebuilt its existing AIP 345kV transmission line that traverses the Gila National Forest from wood to steel. This project, TL302, is addressed later in my testimony.

EPE also takes preventative measures to routinely clear the right-of-way ("ROW") of encroaching trees and remove any unauthorized structures that could threaten the lines or contribute to wildfire risks. EPE regularly patrols each transmission line to check for ROW changes and obstructions, conducting visual inspections and maintenance while reporting any damage. Contractors are also employed for above-ground and subsurface inspections and testing of wood pole transmission structures.

Q34. HOW DOES EPE PLAN AND PREPARE FOR HIGH HEAT EXPOSURE?

A. To avoid heat-related outages, utilities must closely monitor seasonal loading and equipment capacities. Compliance with NERC's planning requirements ensures that BES capacities and thermal ratings are not exceeded during peak summer loads. EPE, like other utilities, continually assesses its high-voltage transmission and substation equipment to manage capacity and thermal ratings effectively.

Q35. DOES EPE HAVE AN INTERNAL APPROVAL PROCESS FOR NEW TRANSMISSION AND SUBSTATION PROJECTS?

A. Yes. The are three primary project identification channels. First, EPE's development of the Ten-year System Expansion Plan includes joint review with TSR and System Operations engineering and Operations Management prior to issuance of the plan. Second, Large and Small Generator Interconnections are managed via the FERC-approved OATT process. Third, betterment projects to address aging infrastructure and asset replacement are reviewed annually by an established Betterment Committee. Transmission and substation projects that are identified follow a scoping process to define the requirements and priority of all projects. In the scoping process, each project is reviewed with the applicable EPE departments to pre-define and identify any obstacles or conflicts associated with

the proposed route or site, any land or rights-of-way acquisition or permitting requirements, any viable alternatives, supply chain management constraints, and finally the project's priority to schedule the required resources for the project. On an annual basis, the capital projects are reviewed by senior leadership and provided to executive leadership for approval. Any individual non-blanket project over $25M goes to the Board for approval.

B. IDENTIFYING THE NEED FOR DISTRIBUTION CAPITAL INVESTMENTS

Q36. HOW DOES EPE IDENTIFY THE NEED FOR NEW DISTRIBUTION PROJECTS?

A. Distribution system capital projects are driven by customer service requests, customer load growth, service reliability improvements, and compliance with the American National Standards Institute ("ANSI") electric service standards. The ANSI standards define service voltage standards and the acceptable range of variation above and below the standard, i.e., the electric service voltage single-phase standard is 120/240 Volts with a maximum variation from that standard of plus or minus five percent. Additionally, some capital projects are identified and defined in the regular course of EPE's annual O&M inspections; in response to an unexpected distribution outage event caused by weather, vegetation, vehicles, construction

equipment, etc.; or a combination of both. Distribution system expansion projects are listed and defined in an internal document referred to as the 10-year Distribution System Expansion Plan.

Q37. DOES EPE HAVE AN INTERNAL APPROVAL PROCESS FOR NEW DISTRIBUTION PROJECTS?

A. Yes. Distribution projects that are identified and defined in the 10-year Distribution System Expansion Plan follow a scoping process to define the requirements and priority of the projects. In the scoping process, each project is reviewed with the applicable EPE departments to pre-define and identify any obstacles or conflicts associated with the proposed route or site, any land or rights-of-way acquisition or permitting requirements, and any alternatives, and finally the project's priority to schedule the required resources for the project. On an annual basis, capital projects are reviewed by senior leadership and provided to executive leadership for approval. Any individual non-blanket project over $25M goes to the Board for approval.

C. PROCEDURES TO MANAGE COSTS

Q38. DOES THE COMPANY HAVE PROCEDURES IN PLACE TO MANAGE COSTS ASSOCIATED WITH TRANSMISSION AND DISTRIBUTION PROJECTS?

A. Yes. For non-stock materials and construction services for T&D projects exceeding $150,000, EPE solicits bids through a formal competitive bidding process. Excluding professional services, EPE also requires competitive bids for all non-stock purchases when the total value of the goods or services equals or exceeds $25,000. However, informal telephone and email bids conducted by the requesting department are acceptable for purchases from $25,000 up to $149,999.

Requests for competitive bid negotiations are forwarded to EPE's Supply Chain Management group for further processing and review as needed. EPE also works with alliance manufacturing partners that help standardize the large equipment and help streamline the process of procurement. These alliances are checked against market for lead times and cost every three years.

A purchase requisition with all necessary information and management approvals will then be submitted to EPE's Supply Chain Management group for processing. All requests for bids, with appropriate EPE bid number and bid due date, will be sent to a minimum of three qualified and approved suppliers, provided that three qualified and approved suppliers for that service or material exist.

Q39. WHAT INFORMATION IS INCLUDED IN THE REQUEST FOR BIDS THAT EPE PROVIDES FOR CONTRACTOR SERVICES?

A. Bid specifications will include a statement of work and will clearly state the supplier's obligations and responsibilities for all areas of the work or services to be performed. This includes but is not limited to safety, sanitation, and all other aspects of the work to be performed or provided. Bid specifications will include a time frame for the completion of the necessary work or service. Specifications may also include a detailed performance guarantee clause, if applicable. Pre-bid meetings and tours of the project site will be conducted when appropriate.

Q40. WHAT PROCESS DOES EPE FOLLOW WHEN IT RECEIVES THE BIDS FROM SUPPLIERS?

A. Upon receipt of the bids, the Supply Chain Management group will issue a summary report to the user who requested the bid. It will include price quotes by supplier, copies of the bids, the recommended supplier, and the reason for the selection. All information received pertaining to bid packages will remain strictly confidential. Supplier pricing and services will never be discussed with other competing suppliers. Supply Chain Management may notify all participants as to which supplier the bid was awarded. Work performed by contractors or consultants

will not begin until a purchase order ("PO") has been issued. In all cases, contractors and consultants, including subcontractors, must provide proof of required insurance before a PO will be issued.

The Company reserves the right to reject any or all bids. Additionally, the Company reserves the right to deviate from written policies and related procedures when, upon a showing of good cause and with the approval of senior management, it is in the best interest of the Company and its customers.

Q41. WHAT OTHER PRACTICE DOES EPE FOLLOW TO ENSURE THAT COSTS INCURRED FOR T&D PROJECTS ARE REASONABLE?

A. When appropriate, EPE will use its own labor resources to help control costs. If, however, a particular task or project requires resources or skills that EPE does not have, or that are not available, outside contractors are employed. Outside contractors are subject to the procurement process described above.

VI. T&D CAPITAL INVESTMENTS

A. TRANSMISSION CAPITAL PROJECTS

Q42. WHAT IS EPE'S TRANSMISSION CAPITAL INVESTMENT PLACED IN SERVICE SINCE THE 2020 RATE CASE?

A. The total Company amount of additional transmission plant in service since the 2020 Rate Case is $251,472,746. These costs include $250,811,869 for total Company transmission plant additions since the 2020 Rate Case through the Base Period ending September 30, 2025, as adjusted for the Test Year Period to include $660,877 of total Company transmission plant placed into service in October 2025. A complete list of the total Company transmission capital projects that were completed and placed into service for the Test Year Period is provided by EPE witness Prieto and listed in Exhibit CSP–1. As addressed by EPE witness Hernandez, the New Mexico jurisdictional amount of transmission capital additions is $55,592,040.

Q43. WHAT ARE THE MAJOR LARGE TRANSMISSION PROJECT CAPITAL ADDITIONS THAT EPE SEEKS TO INCLUDE IN RATE BASE?

A. Non-blanket large transmission projects with a cost of $5 million or more, as identified in EPE witness Prieto's Exhibit CSP-1, that EPE is requesting to be included in rate base are presented in Table OAG - 2 below. I describe each of these projects in the following section of my testimony.

Table OAG – 2

PROJECT	PROJECT DESCRIPTION	ADJUSTED TOTAL COMPANY GROSS ADDITIONS
TL302	AIP WOOD TO STEEL STRUCTURES PHASE ONE	$ 41,349,329
TL245 (1)	SEABECK TO SAN FELIPE 115 KV TRANSMISSION LINE	$ 24,095,953
TL295	OTERO 345KV NEW SUBSTATION & TRANSMISSION LINE ADJUSTMENTS	$ 19,657,560
TS142	EDDY WINDFARM 345KV INTERCONNECTION SUBSTATION	$ 15,909,819
TL119	JORNADA - MOONGATE 115KV TRANSMISSION LINE	$ 13,615,691
TS148	ROBERTS 115KV INTERCONNECTION SUBSTATION	$ 10,398,636
TS125	PICANTE 345KV SUBSTATION REACTOR ADDITION	$ 9,542,696
TL243	SEABECK - HORIZON 115KV TRANSMISSION LINE	$ 7,865,330
TP101	SPRINGERVILLE CIRCUIT BREAKER REPLACEMENT	$ 5,394,983
TL312	CLINT TO VALLEY LINE UPGRADE	$ 5,218,346

(1) Adjusted total Company gross addition includes plant placed into service in October 2025

1. PROJECT NUMBER 1 – TL302

Q44. WHAT IS PROJECT TL302 - AIP WOOD-TO-STEEL STRUCTURE REPLACEMENT?

A. This is a $41.35 million ($9.61 million New Mexico jurisdiction) wood to steel structure conversion along the 345 kV Macho Springs–Springerville (also referred to as the Arizona Interconnection Project) ("AIP") transmission line. This is a $41.35 million ($9.61 million New Mexico jurisdiction) wood-to-steel structure

conversion along the 345 kV Macho Springs–Springerville (also referred to as the Arizona Interconnection Project) ("AIP") transmission line. The AIP transmission line is 199.93 miles long and extends through the northern region of the Gila National Forest in Southwest New Mexico.

The Project included replacing two hundred ninety-nine (299) structures along a fifty (50) mile stretch of the AIP transmission line (please see Exhibit OAG-4 for project pictures). The Project included replacing 299 structures along a 50-mile stretch of the AIP transmission line (please see Exhibit OAG-4 for project pictures). The Project also included replacing 345kV insulator assemblies for 36 existing lattice tower structures.

Q45. WHY WAS THE AIP WOOD-TO-STEEL STRUCTURE REPLACEMENT PROJECT NEEDED?

A. The AIP transmission line is critical to EPE's system and is part of WECC Path 47, a vital path for importing EPE's Palo Verde remote generation to meet native load. During peak load season, when EPE is typically importing above 400MW of power, a sustained outage would have a detrimental impact to the reliability of our grid.

The older wood structures, which are prone to rotting, deterioration, high wind damage, and pose an increased wildfire risk, contributed to increased risk of long-term outages to this 345kV transmission line.

The rebuilding of this line also greatly reduces maintenance costs, and this type of system hardening is part of EPE's wildfire mitigation efforts. The structure and insulator replacement will contribute to system resilience and reliability for EPE's entire transmission system.

Q46. CAN YOU ELABORATE ON THE RISK FROM WILDFIRES TO THE AIP TRANSMISSION LINE?

A. Yes. The Gila National Forest and areas surrounding the AIP transmission line are prone to and have experienced numerous large wildfires annually over the last six years and three of the state's largest: the Whitewater-Baldy Fire, which burned approximately 300,000 acres in 2012, the Silver Fire, which burned approximately 140,000 acres in 2013, and the Black Fire, which burned approximately 325,000 acres in 2021. The Gila National Forest and areas surrounding the AIP transmission line are prone to and have experienced numerous large wildfires annually over the last six years and three of the state's largest wildfires: the Whitewater-Baldy Fire, which burned approximately 300,000 acres in 2012, the Silver Fire, which burned approximately 140,000 acres in 2013, and the Black Fire, which burned approximately 325,000 acres in 2021. EPE's formal documentation of wildfires in proximity to EPE facilities since 2020 shows at least six wildfires came within 10 miles of the AIP transmission line, prior to the wood-to-steel conversion project,

including the 2023 Dolan Fire which came within one mile of the AIP line. My Exhibit OAG-4 provides further details regarding the fires since 2020.

Q47. WERE THERE ALTERNATIVES TO CHANGING OUT THESE WOOD STRUCTURES?

A. There were no reasonable alternatives. EPE theoretically could have delayed replacing the wooden structures. However, that would have increased risk to the transmission system and sensitive wildfire-prone areas such as the Gila National Forest and compromised the reliability of our system.

Q48. SINCE THE PROJECT WAS COMPLETED, HAS THE AIP TRANSMISSION LINE BEEN EXPOSED TO A WILDFIRE?

A. Yes. In June 2025 the Buck Fire burned more than 50,000 acres and crossed 50 structures along the 345kV Macho Springs–Springerville AIP transmission line. Critically, the fire intersected around eight miles of this line, which was the very segment that was recently upgraded as part of the TL302 wood-to-steel pole conversion project. Images of the Buck Fire aftermath are included in Exhibit OAG-04. EPE's proactive investment likely prevented structural failure and mitigated the risk of broader system reliability impacts. The incident underscores

the importance of continued infrastructure hardening to protect essential transmission assets from wildfire-related disruptions.

Q49. WAS PROJECT TL302 - AIP WOOD-TO-STEEL STRUCTURE REPLACEMENT PROJECT A REASONABLE AND NECESSARY INVESTMENT?

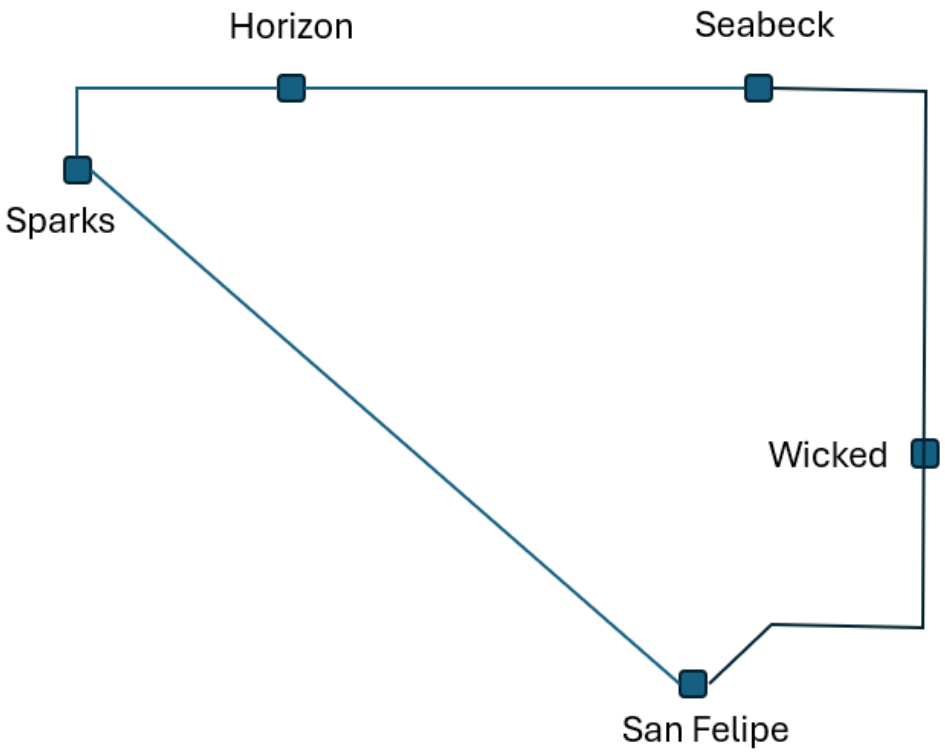
A. Yes. This system hardening project is part of EPE's wildfire mitigation efforts, which reduce the likelihood of prolonged outages and position EPE to better serve its customers and respond to the evolving climate challenges.

2. PROJECT NUMBER 2- TL245

Q50. WHAT IS PROJECT TL245 – SEABECK TO SAN FELIPE 115 kV TRANSMISSION LINE?

A. This $24.10 million project ($5.60 million New Mexico jurisdiction) is a new 115 kV transmission line that is 18.34 miles located in the eastern region of El Paso County, Texas. This new 115kV transmission line extends from the new Seabeck Substation to the new San Felipe Substation. This is a new transmission line segment, in combination with the additional segment of Project Number TL243 discussed later in my testimony, are part of the creation of a 115kV as shown in Figure OAG-3.

Figure OAG-3



The new 115kV transmission loop will:

- Improve Reliability for the BES: In conducting N-1 contingency planning analysis for 2019, EPE transmission planners identified a NERC Transmission Planning (TPL) reliability requirement [TPL Standard 001-4] that needed to be solved for reliability purposes. The transmission loop associated with this project resolves the projected requirement. In particular, by creating a loop, the transmission system will gain an alternate

path for power flow, which enhances reliability. This redundancy helps prevent outages, especially during peak demand or emergency situations.

- Voltage Support: The new line provides better transmission voltage support, ensuring that voltage levels remain within acceptable limits, which is crucial for the efficient operation of electrical equipment and overall system stability.

The other portions of the loop will include the two existing transmission segments upgraded from 69 kV to 115 kV, Horizon – Seabeck and Felipe – Sparks.

Q51. WERE THERE ALTERNATIVES TO THIS PROJECT?

A. EPE considered the possible alternative of rebuilding and increasing the capacity of eight transmission lines that are otherwise projected to overload in 2024-2025 under the contingencies analyzed. EPE rejected this approach because EPE estimated that upgrading these eight existing transmission lines and related equipment would be more than the total projected costs for the 115kV transmission loop project. Additionally, the alternative of upgrading the existing transmission lines alone would not provide an infrastructure backbone, which is an additional benefit of the 115kV transmission loop project.

Q52. IS PROJECT TL245 – SEABECK TO SAN FELIPE 115KV TRANSMISSION LINE REASONABLE AND NECESSARY?

A. Yes. EPE's System Planning demonstrated that the line was essential for improving the system and addressing identified planning standard requirements. Building this new line was the least costly and most effective alternative to ensure the ability to serve load to EPE's customers. The project was designed to meet current and future demand, maintain system reliability, and provide necessary voltage support, making it a critical investment for the region's power infrastructure.

3. PROJECT NUMBER 3 – TL295

Q53. WHAT IS PROJECT TL295 - OTERO 345KV INTERCONNECTION SUBSTATION?

A. This $19.66 million project ($4.57 million New Mexico jurisdiction) is a new 345kV interconnection substation necessary to energize the Buena Vista Solar Project in Otero County, New Mexico. This substation will initially employ a ring bus configuration based on the Large Generator Interconnection Agreement ("LGIA") executed between EPE and the generator and the facilities studies conducted to support it. EPE executes interconnection agreements with generators pursuant to the required interconnection agreements and procedures for large and small generators, as applicable, promulgated by the FERC.

Q54. WAS THE OTERO 345KV INTERCONNECTION SUBSTATION PROJECT NEEDED?

A. Yes. The 345kV interconnection substation project was required to support the interconnection of the 120MW Solar and 50 MW battery storage Buena Vista Project discussed in the Direct Testimony of EPE witness Victor Martinez. With an executed LGIA in place, EPE was obligated to complete this interconnection substation.

As discussed by Mr. Martinez, the Buena Vista Project was selected from a competitive bidding process to meet load growth in EPE's service territory. EPE purchases the solar energy and capacity generated by the Buena Vista Project pursuant to a Commission-approved PPA.

Q55. WAS THERE AN ALTERNATIVE TO COMPLETING THE OTERO SUBSTATION?

A. No. EPE was complying with the requirements of the LGIA and completed all the necessary studies to accommodate this request. It was determined that, at this location, this substation was needed to intercept the 345kV transmission line and to bring in the tie-line to the Buena Vista facility.

Q56. WAS PROJECT TL295 - OTERO 345KV INTERCONNECTION SUBSTATION PROJECT REASONABLE AND NECESSARY?

A. Yes. EPE's System Interconnection department and TSR Engineering department determined that this substation design was the most optimal to meet all the requirements of the LGIA.

4. PROJECT NUMBER 4 – TS142

Q57. WHAT IS PROJECT TS142 - EDDY WINDFARM 345KV INTERCONNECTION SUBSTATION?

A. This $15.91 million project ($3.70 million New Mexico jurisdiction) is a new 345kV interconnection substation project necessary for a wind facility, the Oso Grande Wind Project. The wind facility is located in southeastern New Mexico and is owned by TEP. This substation will employ a ring bus configuration based on the LGIA and the facilities studies conducted to support it.

Q58. WHY WAS THE EDDY WINDFARM 345KV INTERCONNECTION SUBSTATION PROJECT NEEDED?

A. The location, design and construction of the Eddy Windfarm 345 interconnection substation is a product of EPE’s implementation of the FERC Large Generator

Interconnection Procedures for a 250MW wind facility. With an executed LGIA in place, EPE was obligated to complete this interconnection substation.

Q59. WAS THERE AN ALTERNATIVE TO COMPLETING EMPIRE SUBSTATION?

A. No, EPE was complying with the LGIA and completed all the necessary studies to accommodate this request. It was determined that at this location, this substation needed to be built to intercept the nearby 345kV transmission line and to bring in the tie-line to the Oso Grande facility.

Q60. WAS PROJECT TS142 - EDDY WINDFARM 345KV INTERCONNECTION SUBSTATION PROJECT REASONABLE AND NECESSARY?

A. Yes. EPE's System Interconnection department and TSR Engineering department determined that this substation design was the most optimal to meet all the requirements of the LGIA and covered the facility studies and system impacts. Since the wind project went into commercial operation, TEP pays approximately $4.9 million annually in transmission service based on EPE's FERC-approved OATT rate. TEP utilizes EPE’s transmission to move energy across EPE's system

into Arizona. The revenues are credited back to EPE's retail customers as an offset to the Test Year Period revenue requirement.

5. PROJECT NUMBER 5 – TL119

Q61. WHAT IS PROJECT TL119 – JORNADA - MOONGATE 115KV TRANSMISSION LINE?

A. This $13.62 million project ($3.16 million New Mexico jurisdiction) is a new 115 kV transmission line that is 9.06 miles long and is located in the central region of Doña Ana County, New Mexico. This new 115kV transmission line is between EPE's Jornada and Moongate substations.

Q62. WHY WAS THE JORNADA - MOONGATE TRANSMISSION NEW LINE PROJECT NEEDED?

A. This new 115kV transmission line extends an existing line from the Jornada Substation to the Moongate Substation. Extension of this line allows for the creation of a transmission loop that will:

- Improve Reliability for the BES: In conducting N-1 contingency planning analysis for 2019, EPE transmission planners identified a NERC Transmission Planning ("TPL") reliability requirement [TPL Standard 001-4] that needed to be solved for reliability purposes. The transmission loop

associated with this project resolves the projected requirement. In particular, by creating a loop, the transmission system will gain an alternate path for power flow, which enhances reliability. This redundancy helps prevent outages, especially during peak demand or emergency situations.

- Voltage Support: The new line provides better transmission voltage support, ensuring that voltage levels remain within acceptable limits, which is crucial for the efficient operation of electrical equipment and overall system stability.

The other portions of the loop will include a transmission circuit from the Moongate Substation back to the Company's 345/115kV Arroyo Substation.

Q63. WHAT WOULD HAVE BEEN THE CONSEQUENCES OF NOT BUILDING THIS NEW TRANSMISSION LINE?

A. Not building this new transmission line would have had several negative consequences as reflected in the NERC TPL standards discussed above:

- Strain on Existing Infrastructure: The existing transmission system would struggle to handle the increasing load, leading to potential overloads and increased risk of outages.

- Inability to Serve Growing Demand: As customer demand rises, the existing lines would face higher loading and thermal stress, making it difficult to maintain reliable service.

Q64. WERE THERE ALTERNATIVES TO THIS PROJECT?

A. No. The project was required for system reliability, and there were no viable alternatives to improving the transmission system in this region. The Distribution and System Planning departments conducted a thorough analysis of the Company's growing needs and the existing transmission system. They determined that constructing this 115kV transmission line to allow for the creation of a transmission loop was the least costly and most effective solution.

Q65. DOES PROJECT TL119 JORNADA-MOONGATE HAVE AN AMENDMENT TO THE 440 FILING?

A. Yes. EPE amended EPE 440 Number 75 on March 23, 2026. EPE 440 Number 75 includes projects TL119 and DN164 which is the distribution underbuilt attached to the transmission structures. The project's original cost estimate was $12,807,153. The final, amended amount is $ 16,937,995 ($6,485,270 New Mexico jurisdiction).

Q66. WHAT WERE THE CAUSES FOR THE AMENDED COST?

A. EPE experienced delays in the ROW acquisition and was required to negotiate routing redesigns. This delay pushed the project into the COVID-19 pandemic supply chain disruptions that resulted in equipment cost increases and lead time extensions. Additionally, increased labor costs for construction associated with the COVID-19 disruptions impacted contractor costs.

Q67. WAS PROJECT TL119 – JORNADA - MOONGATE 115KV TRANSMISSION LINE REASONABLE AND NECESSARY?

A. Yes. EPE's System Planning demonstrated that the line was essential for improving the system and addressing identified planning standard requirements. Building this new line was the least costly and most effective alternative to ensure the ability to serve load to EPE customers in New Mexico and Texas. The project was designed to meet current and future demand, maintain system reliability, and provide necessary voltage support, making it a critical investment for the region's power infrastructure.

6. PROJECT NUMBER 6 – TS148

Q68. WHAT IS PROJECT TS148 – ROBERTS 115KV INTERCONNECTION SUBSTATION?

A. This $10.40 million project ($2.42 million New Mexico jurisdiction) is a new 115kV substation project required to interconnect the Newman-Picante and the Newman-Pipeline 115kV transmission lines into a new Roberts Substation located in west El Paso County, Texas. This substation employs a breaker-and-half configuration based on the requirements of the LGIA required for Newman Unit 6.

Q69. WHY WAS THE ROBERTS 115kV INTERCONNECTION SUBSTATION PROJECT NEEDED?

A. The location, design and construction of the Roberts 115 kV substation is a product of EPE's implementation of the FERC Large Generator Interconnection Procedures. This project is for the purpose of interconnecting to the EPE transmission system a new 228-MW unit at Newman Power Station, namely Newman Unit 6. The project expenditure represents additions and modifications to the transmission system and does not include facilities upstream of the point of interconnection. Facilities upstream of the point of interconnection (from the location of the generating unit to the substation) are not included in EPE's proposed New Mexico rate base. EPE initially considered connecting Unit 6 to the transmission grid through expansion of the existing Newman substation. However, short circuit issues and other limitations of the existing substation's equipment and configuration resulted in the identification of the point of interconnection's

location. The ultimate location of the point of interconnection was identified during the interconnection process. The point of interconnection required construction of a substation at that location. Not only does the point of interconnection substation avoid reliability issues, such as short circuit exceedances, it provides reliability benefits to the transmission network and all those who use the transmission network, as detailed further below.

Q70. IS THE ROBERTS SUBSTATION INTEGRATED INTO THE EPE TRANSMISSION NETWORK?

A. Yes.

Q71. DOES POWER MOVE THROUGH THE ROBERTS SUBSTATION AS THE TRANSMISSION NETWORK SERVES LOAD CONNECTED TO THE NETWORK?

A. Yes.

Q72. FOR PROJECT TS148 – ROBERTS 115KV INTERCONNECTION SUBSTATION, CAN YOU DESCRIBE THE RELIABILITY BENEFITS TO THE INTEGRATED TRANSMISSION AND OTHER BENEFITS OF CONSTRUCTING THIS INTERCONNECTION AS A NEW

SUBSTATION?

A. There are many lines entering the existing Newman Substation at present, and the breakers at the station have reached the limits of their ability to interrupt short circuit fault current. Thus, interconnecting Newman Unit 6 to the transmission network at a separate location mitigates the risk that would have come from force fitting another unit at Newman Substation. The potential risk for generation outages at the existing Newman Substation would have increased substantially, impacting all generation at the Newman Power Station. With the new point of interconnection established for Unit 6, in circumstances in which there was a significant outage at Newman Substation, Newman Unit 6 may still operate via Roberts Substation where Unit 6 output would enter the transmission network. Additionally, Roberts Substation is also connected to two existing 115kV transmission lines downstream of Newman to EPE's far east load pocket. These benefits bring reliability and resiliency benefits to the BES grid. Finally, building a new Roberts Substation allowed EPE to achieve the new generation interconnection without having to do major reconstruction of an energized substation and avoided unnecessary risk to EPE personnel.

Q73. WHAT DOES FERC REQUIRE WHEN A NEW SUBSTATION IS CONSTRUCTED AS A RESULT OF A GENERATOR INTERCONNECTION REQUEST?

A. FERC requires facilities at or beyond the point of interconnection to be paid for by all users of the transmission network. FERC's generator interconnection rules are rooted in the premise that all users of the transmission network benefit from network upgrades.

Q74. IS THAT TRUE EVEN IN SITUATIONS IN WHICH NOT ALL USERS OF THE TRANSMISSION NETWORK PURCHASE THE OUTPUT OF THE GENERATING FACILITY INTERCONNECTED AT THE SUBSTATION? IF SO, WHY?

A. Yes. While some users may not purchase the output of the specific generating facility whose interconnection request triggered the installation of the specific substation, those substation facilities are considered part of the integrated transmission network. The integrated transmission network serves all users of the network.

Q75. DO RETAIL CUSTOMERS IN NEW MEXICO USE THE INTEGRATED TRANSMISSION NETWORK?

A. Yes.

Q76. WAS PROJECT TS148 – ROBERTS 115KV INTERCONNECTION SUBSTATION PROJECT REASONABLE AND NECESSARY?

A. Yes. EPE's System Interconnection department studied and EPE's TSR department evaluated the facilities, their design, their configuration and their capabilities and determined the Roberts Substation was the most optimal to meet all the requirements of the LGIA.

7. PROJECT NUMBER 7 – TS125

Q77. WHAT IS PROJECT TS125 - PICANTE 345KV SUBSTATION MODIFICATIONS PROJECT?

A. EPE's Caliente to Amrad 345 kV transmission line runs adjacent to Picante Substation. Under this $9.54 million project ($2.22 million New Mexico jurisdiction), this line was reconfigured to interconnect to the substation's ring bus which also required modification. The substation modifications included the addition of three 345 kV gas circuit breakers as well as disconnect switches with motor operated devices to the substation. A new in-line 345 kV shunt reactor was also installed at Picante Substation to help with voltage support on the 345 kV transmission line.

Q78. WHY WERE THE PICANTE 345KV SUBSTATION MODIFICATIONS NEEDED?

A. Project TS125 was identified in EPE's transmission system expansion plan to help support the 345kV transmission system. In conjunction with the Otero project, described above, this line re-configuration and substation modification project created two parallel transmission line paths from Picante Substation to Caliente Substation and a single transmission path from Picante to Otero and Otero to Amrad. This project was needed to help create another transmission path to critical substations in this region of the system to support NERC TPL-001 standard requirements, and it improves the accessibility of conducting emergency or routine maintenance on these critical transmission lines.

Q79. WERE THERE ALTERNATIVES TO THIS PROJECT?

A. No. The Caliente-Picante transmission line could have bypassed Picante Substation and gone straight to Otero Substation. However, doing so would have limited the transmission paths into EPE's eastern portion of EPE's 345kV system and would have adversely impacted the flexibility required for EPE to perform maintenance on transmission lines in this region, reducing voltage stability during an N-1 contingency.

Q80. WAS PROJECT TS125 - PICANTE 345KV SUBSTATION REACTOR ADDITION PROJECT A REASONABLE AND NECESSARY INVESTMENT?

A. Yes. An analysis by EPE's System Planning and TSR determined that this substation modification was the most optimal to meet all the requirements needed by this portion of EPE's transmission system.

8. PROJECT NUMBER 8 – TL243

Q81. WHAT IS PROJECT TL243 SEABECK TO HORIZON 115KV TRANSMISSION LINE?

A. This $7.87 million project ($1.83 million New Mexico jurisdiction) upgraded existing 69 kV transmission infrastructure to a 7.3 mile, 115 kV transmission line in the eastern region of El Paso County, Texas. This 115kV transmission line is between EPE's Horizon and Seabeck Substations. This new transmission line segment is also part of the 115kV loop in Figure XX described earlier in testimony as part of project TL245.

Q82. WHY WAS THE SEABECK – HORIZON TRANSMISSION NEW LINE PROJECT NEEDED?

A. This new 115kV transmission line extends from the new Seabeck Substation to the Horizon Substation. The new transmission line extension emanating from the Horizon – Seabeck transmission line will provide a new 115kV transmission loop that will:

- Improve Reliability for the BES: In conducting N-1 contingency planning analysis for 2019, EPE transmission planners identified a NERC Transmission Planning (TPL) reliability requirement [TPL Standard 001-4] that needed to be solved for reliability purposes. The transmission loop associated with this project resolves the projected requirement. In particular, by creating a loop, the transmission system will gain an alternate path for power flow, which enhances reliability. This redundancy helps prevent outages, especially during peak demand or emergency situations.
- Voltage Support: The new line provides better transmission voltage support, ensuring that voltage levels remain within acceptable limits, which is crucial for the efficient operation of electrical equipment and overall system stability.

The other portions of the loop will include the rebuild of the new Seabeck – Horizon 115 kV transmission line and the existing Felipe – Sparks 69kV transmission circuit upgraded to 115kV.

Q83. WHAT WOULD HAVE BEEN THE CONSEQUENCES OF NOT BUILDING THIS NEW TRANSMISSION LINE?

A. Not building this new transmission line would have had several negative consequences as reflected in the NERC TPL standards discussed above:

- Strain on Existing Infrastructure: The existing transmission system would struggle to handle the increasing load, leading to potential overloads and increased risk of outages.
- Inability to Serve Growing Demand: As customer demand rises, the existing lines would face higher loading and thermal stress, making it difficult to maintain reliable service.

Q84. WERE THERE COST-EFFECTIVE ALTERNATIVES TO THIS PROJECT?

A. No. Upgrading the capacity of existing transmission lines such as through voltage upgrades, bundling conductors along existing facilities, or reconductoring existing lines potentially could have addressed the need, but those approaches were rejected as more costly than the proposed project. Specifically, the alternatives to the new 115kV transmission loop would have been to rebuild and increase the capacity of eight transmission lines that are otherwise projected to overload in 2024-2025 under the contingencies analyzed. EPE estimated that upgrading these eight existing

transmission lines and related equipment would be more costly than the total projected costs for the eastside loop expansion project. Additionally, upgrading the existing transmission lines alone would not provide the benefit of providing an infrastructure backbone for required network expansion.

Q85. WAS PROJECT TL243 – HORIZON TO SEABECK 115kV TRANSMISSION LINE REASONABLE AND NECESSARY INVESTMENT?

A. Yes. EPE's System Planning demonstrated that the line was essential for improving the system and addressing identified planning standard requirements. Building this new line was the least costly and most effective alternative to ensure the ability to serve load to EPE customers in New Mexico and Texas. The project was designed to meet current and future demand, maintain system reliability, and provide necessary voltage support, making it a critical investment for the region's power infrastructure.

9. PROJECT NUMBER 9 – TP101

Q86. WHAT IS PROJECT TP101 - SPRINGERVILLE CIRCUIT BREAKER REPLACEMENT PROJECT?

A. This $5.39 million project ($1.25 million New Mexico jurisdiction) consists of the design, procurement, and construction of eighteen (18) 345kV circuit breakers, thirty-four (34) disconnect switches, and other associated equipment at Springerville Substation, of which EPE is a part owner. EPE's allocated cost share was 19.44% of total project costs pursuant to the substation's operating agreement. The project also included the upgrade and replacement of the fencing around Springerville substation with a metal mesh fencing for increased physical security, of which EPE paid for 8.33% of that cost pursuant to the operating agreement.

Q87. WHY WAS THE SPRINGERVILLE CIRCUIT BREAKER REPLACEMENT PROJECT NEEDED?

A. Replacements were needed due to equipment being at end of life.

Q88. WHAT WOULD HAVE BEEN THE CONSEQUENCES OF NOT COMPLETING THIS SPRINGERVILLE CIRCUIT BREAKER REPLACEMENT PROJECT?

A. The circuit breakers replaced were at end of life and could have suffered a catastrophic failure if not replaced. The breakers are vital to the operation of the substation.

Q89. WERE THERE ALTERNATIVES TO COMPLETING THIS CIRCUIT BREAKER REPLACEMENT PROJECT?

A. No. There were no alternatives to completing this circuit breaker replacement. EPE is not the sole owner of this station and together with the other owners, the decision was made to replace the circuit breakers.

Q90. WAS PROJECT TP101 - SPRINGERVILLE CIRCUIT BREAKER REPLACEMENT PROJECT REASONABLE AND NECESSARY?

A. Yes. Although EPE is only a part owner of this facility, it exercised reasonable oversight regarding the project to ensure that the project and its costs were reasonable and necessary.

10. PROJECT NUMBER 10 – TL312

Q91. WHAT IS PROJECT TL312 – CLINT TO VALLEY TRANSMISSION LINE RECONDUCTOR PROJECT?

A. This $5.22 million project ($1.21 million New Mexico jurisdiction) consists of the reconductoring of the Clint to Valley 69kV transmission line in the Clint and Socorro Texas area. It also was a pole-for-pole replacement from wood-to-steel structures with the capacity for a second distribution circuit underbuilt on the transmission line. The distribution circuit itself was not part of this project.

Q92. WHY WAS THE CLINT TO VALLEY TRANSMISSION LINE RECONDUCTOR PROJECT NEEDED?

A. The Clint to Valley project was needed to address and mitigate potential overload conditions under certain transmission event contingencies. With the change in conductor size, a complete replacement of the wood structures was necessary due to all the upgrades to complete reconductoring. Once it was determined that a structure replacement was necessary, a second distribution circuit was added to the transmission structures to help support the additional load growth from Clint Substation.

Q93. WHAT WOULD HAVE BEEN THE CONSEQUENCES OF NOT COMPLETING THIS RECONDUCTOR PROJECT?

A. EPE's System Planning department identified the need to reconductor the Clint to Valley transmission line due to projected overloading conditions. If this project was not completed, this transmission line was projected to overload under contingency planning scenarios and place the system reliability at risk. This would also put in jeopardy the load growth and additional capacity needed in this region.

Q94. WERE THERE ALTERNATIVES TO COMPLETING THIS RECONDUCTOR PROJECT?

A. No, there were no viable alternatives to the reconductoring project. Constructing a separate new transmission line to relieve the projected overloads would have been much more expensive than reconductoring the existing facilities.

Q95. DOES PROJECT TL312 CLINT-VALLEY HAVE AN AMENDMENT TO THE 440 FILING?

A. Yes. EPE amended EPE 440 Number 92 on March 23, 2026. The original cost estimate was $ 8,705,799 and the final, amended amount is $ 5,218,346 ($1,212,237 New Mexico jurisdiction).

Q96. WHAT WERE THE CAUSES FOR THE AMENDED COST?

A. The adjustment is attributable to decreased costs for labor and traffic control. The initial estimate assumed added costs to work nighttime hours; however, the Department of Transportation approved daytime lane closures which resulted in lower labor costs. Additionally, materials were procured at a lower cost than originally estimated.

Q97. WAS THE CLINT TO VALLEY TRANSMISSION LINE RECONDUCTOR PROJECT REASONABLE AND NECESSARY?

A. Yes. Transmission Engineering verified that the required upgrades addressed all system planning contingencies and projected overloading impacts to the 69kV system.

11. ADDITIONAL TRANSMISSION CAPITAL PROJECTS

Q98. WHAT OTHER TRANSMISSION PROJECTS WITH COSTS GREATER THAN $1 MILLION ARE INCLUDED IN THIS RATE APPLICATION?

A. My Exhibit OAG-5 presents transmission projects and their associated costs with project descriptions for all projects with a cost greater than $1 million but less than $5 million; transmission blanket projects with a total cost greater than $1 million are also included in Exhibit OAG-5 Transmission blanket projects are standing projects that are utilized to cover smaller, recurring initiatives that arise such as transmission segment rebuilds due to forced outages, required structure replacements identified during inspections, and investments to meet changing NERC Reliability Standards.

Q99. DO ANY OF THE PROJECTS ON EXHIBIT OAG-5 HAVE AMENDMENTS TO THE 440 FILING?

A. Yes. Project TL316 Lane to Wrangler Reconductor is the only project that has an amended 440. EPE 440 Number 104 on March 23, 2026. The original cost estimate was $2,047,959. The final, amended project amount is $1,187,042 ($275,753 New Mexico jurisdiction). The adjustment is attributable to decreased costs for labor and traffic control. The initial estimate assumed added costs to work nighttime hours; however, the Department of Transportation approved daytime lane closures which resulted in lower costs.

Q100. ARE THE COSTS OF ALL THE TRANSMISSION PROJECTS LISTED IN MS. PRIETO'S EXHIBIT CSP-1 REASONABLE AND NECESSARY TO PROVIDE SAFE AND RELIABLE SERVICE TO CUSTOMERS?

A. Yes. The costs are reasonable and necessary to provide safe and reliable service. The transmission projects are necessary to serve anticipated load growth, improve overall reliability and functionality of EPE's system, adhere to applicable reliability standards, and are subject to EPE's procurement processes and procedures to ensure the reasonableness and prudence of the costs. All of the projects are used and useful as well.

B. DISTRIBUTION CAPITAL PROJECTS

Q101. WHAT AMOUNT OF NEW MEXICO DISTRIBUTION PLANT ADDITIONS HAS EPE PLACED IN SERVICE SINCE THE 2020 RATE CASE?

A. Since the 2020 Rate Case, EPE has placed $197,344,455 of additional distribution plant in service in New Mexico, including $2,730,644 of distribution plant placed in service in New Mexico in October 2025. As described in the testimony of EPE witness Hernandez, New Mexico distribution plant costs are directly assigned to New Mexico. A list of these New Mexico distribution projects is provided by EPE witness Prieto in her Capital Additions Exhibit CSP-1. These projects are discussed further in my testimony.

Q102. WHAT ARE THE MAIN FACTORS THAT DETERMINE THE NEED FOR CAPITAL INVESTMENT IN THE NEW MEXICO DISTRIBUTION SYSTEM?

A. Load growth and maintaining reliability are the main factors that drive the need for capital investments in the New Mexico distribution system. New facilities are required to reliably serve EPE's expanding customer load growth. Existing facilities need to be proactively replaced as they reach the end of their useful lives to maintain acceptable reliability and to be reactively replaced if they fail or

premature failures due to aging.

Q103. PLEASE DESCRIBE TABLE OAG-3.

A. Table OAG-3 identifies the largest New Mexico distribution projects placed into service between January 1, 2020, and October 31, 2025. The single criterion that I have used in developing Table OAG-3 is a total cost amount to distinguish major distribution projects from other projects. Those non-blanket projects that cost more than $5 million per project and have been placed in service from January 1, 2020, through October 31, 2025, are listed below. Non-blanket projects under $5 million total approximately $17 million and predominantly consist of New Mexico distribution projects such as distribution substation and feeder additions, expansions, and other infrastructure betterments to meet load requirements and maintain reliability. While the New Mexico distribution capital projects that EPE requests be placed into rate base are used and useful and have been constructed in a prudent manner at a reasonable cost, I describe the projects over $5 million in greater detail for ease in reference and to highlight the key distribution capital projects since the Company's last general rate case.

Q104. WHAT ARE THE LARGEST DISTRIBUTION SUBSTATION PROJECTS LISTED?

A. The largest non-blanket New Mexico distribution projects by cost are outlined in Table OAG-3 and are as follows:

Table OAG-3

PROJECT	PROJECT DESCRIPTION	ADJUSTED NEW MEXICO GROSS ADDITIONS
DN185	TALAVERA SUBSTATION	$ 16,463,086
DN145	MOONGATE SUBSTATION	$ 14,047,540

1. PROJECT NUMBER 1 – DN185

Q105. WHAT IS PROJECT DN185 TALAVERA SUBSTATION?

A. Project DN185 is a $16.46 million-dollar project to construct a new substation, Talavera substation, in southeast Las Cruces. Talavera substation is a 115/23.9 kV distribution substation serving the rapid load growth in that area which will exceed capacity of existing Salopek and Arroyo substations. Talavera substation was constructed as a six-position 115 kV ring bus, with two 50 MVA distribution power transformers, and two distribution switchgears, which connect four distribution feeders. The Talavera Substation has modernized transformer protection and controls that allow for automatic load restoration in the event of one transformer locking out of service due to a fault. The automatic scheme will assess total

transformer loading and if there is sufficient capacity on the second transformer it will transfer distribution feeders and restore load. To meet the rapidly growing electrical load of this area, EPE needed to construct and place the new Talavera substation in service in 2023.

Q106. WHY WAS THIS PROJECT NEEDED?

A. Talavera substation is needed to serve increasing customer load in the area and alleviate load on Salopek and Arroyo substations. In 2007, the peak load of Salopek and Arroyo were at 82% of capacity and projected to exceed 92% by 2013 due to load growth and development in the southeast area of Las Cruces. It is necessary to keep capacity loading to below 80% to ensure sufficient capacity for addressing unforeseen forced outages. During forced outages (due to structure/crossarm failures, equipment failures, etc.), sufficient capacity is required to reconfigure feeders and offload customers to neighboring feeders for service restoration. EPE's ability to serve load from Salopek substations' east-serving feeders and Arroyo substations' south-serving feeders was very limited and reliability to area critical loads like medical facilities also needed to be maintained. The southeast area of Las Cruces continues to experience moderate growth, including numerous medical facilities which require reliable service supported by a networked distribution network for offloading capacity.

Q107. DOES PROJECT DN185 TALAVERA SUBSTATION HAVE AN AMENDMENT TO THE 440 FILING?

A. Yes. EPE amended EPE 440 Filing No. 70 on March 23, 2026. EPE 440 Filing No. 70 includes project numbers DN185, DN178 and TL254. The original cost estimate was $9,810,967 and the final, amended amount is $19,972,331 on a total Company basis ($18,965,186 on a New Mexico jurisdictional basis).

Q108. WHAT WERE THE CAUSES FOR THE AMENDED COST?

A. The adjustment is in part attributable to supply chain disruptions that resulted in equipment cost increases and lead time extensions. These disruptions were caused by the COVID-19 pandemic which impacted the utility industry along with full economy. Lead-time extensions resulted in an extended project timeline for execution. Additionally, the initial estimate was stochastic. During the project execution, design standards were modified and additional required equipment was identified. Finally, additional costs were added to meet Bureau of Land Management's aesthetics requirements.

Q109. WAS PROJECT DN185 TALAVERA SUBSTATION A REASONABLE AND NECESSARY INVESTMENT?

A. Yes. As described above, this substation is needed to meet current and increasing load growth in this area to provide reliable service to EPE customers.

2. PROJECT NUMBER 2 – DN145

Q110. WHAT IS PROJECT DN145, THE MOONGATE SUBSTATION?

A. DN145 is a $14.05 million project to construct a new substation, Moongate substation, in northeast Las Cruces. Moongate substation is a 115/23.9 kV distribution substation serving the rapid load growth in that area, and it will help support existing Jornada and Arroyo substations as well. The Moongate substation was constructed as an eight-position 115 kV ring bus, with a 50 MVA distribution power transformers, and two distribution switchgears, which connect four distribution feeders. To meet the rapidly growing electrical load of this area, EPE needed to construct and place the new Moongate substation in service in 2023.

Q111. WHY WAS THIS PROJECT NEEDED?

A. Moongate substation is needed to serve increasing customer load in the northeast area of Las Cruces and alleviate load on Jornada, Picacho, and Arroyo substations. In 2011 the area peak load reached a 75% capacity utilization and projected to reach 87% utilization. As described above, it is necessary to maintain sufficient capacity for offloading during forced outages to provide reliable service. Additionally,

EPE's ability to serve load from Jornada and Arroyo substations is very limited and constrained by the distance from these substations to the load centers. Growth in this area is due to the development of residential subdivisions and new commercial loads.

Q112. DOES PROJECT DN145 MOONGATE SUBSTATION HAVE AN AMENDMENT TO THE 440 FILING?

A. Yes. EPE amended EPE 440 Number 72 on March 23, 2026. The original cost estimate was $8,756,828 and the final amended amount is $14,047,540.

Q113. WHAT WERE THE CAUSES FOR THE AMENDED COST?

A. The amendment for this project was in part attributable to supply chain disruptions that resulted in equipment cost increases and lead time extensions. These disruptions were caused by the COVID-19 pandemic which impacted the utility industry along with full economy. Lead-time extensions resulted in an extended project timeline for execution. Additionally, increased labor costs for construction associated with the COVID-19 disruptions impacted contractor costs.

Q114. WAS PROJECT DN145 MOONGATE SUBSTATION A REASONABLE AND NECESSARY INVESTMENT?

A. Yes. As previously described, this substation is needed to serve the increasing load in the area and to serve as support for Jornada and Arroyo substations.

3. BLANKET PROJECTS FOR CUSTOMER CONNECTIONS

Q115. WHICH ARE THE BLANKET PROJECTS ASSOCIATED WITH CUSTOMER CONNECTIONS?

A. There are four distribution blanket projects that are directly associated with customer connections between January 1, 2020, and October 31, 2025. The total capital for these four blankets is $76,274,371 and are listed below.

Table OAG-4

PROJECT	PROJECT DESCRIPTION	ADJUSTED TOTAL COMPANY GROSS ADDITIONS
DN061	NEW MEXICO RESIDENTIAL CONSTRUCTION	$ 34,803,406
DN069	NEW MEXICO COMMERCIAL CONSTRUCTION	$ 27,183,108
MN004	NEW MEXICO METERS	$ 8,676,912
DN068	NEW MEXICO OVERHEAD SERVICE NEW AND/OR REPLACEMENT	$ 5,610,946

Q116. PLEASE DESCRIBE THE FOUR BLANKET PROJECTS AND THEIR PURPOSE AS IT RELATES TO CUSTOMER CONNECTIONS.

A. The first two, DN061 and DN069, are costs associated with new customer connections and include line extension costs per EPE's Commission-approved Line

Extension Policy. This includes installation or replacement of overhead/underground distribution facilities to provide service to new residential customer installations and to provide additional load to existing residential customer installations.

DN068 is also associated with customers connections; however, it is the installation of the customer service drop. This is the final span connecting to customer facilities. Similarly, MN004 is the installation of meters for customer connections.

Q117. ARE THE COSTS OF THE FOUR DISTRIBUTION BLANKET PROJECTS REASONABLE AND NECESSARY TO PROVIDE SAFE AND RELIABLE SERVICE TO CUSTOMERS?

A. Yes. The blanket projects are administered per EPE's Commission approved Line Extension Policy and are necessary to serve customer connections and reliably serve their load growth. Additionally, to add some perspective, there were approximately 8,480 new customers added since December 2019. This results in approximately $8,996 per customer connection, which is reasonable. All of the projects are used and useful as well.

4. NEW MEXICO DISTRIBUTION DAMAGE BLANKET

Q118. WHAT IS BLANKET PROJECT DN065 NEW MEXICO DISTRIBUTION DAMAGE BLANKET?

A. The project is associated with infrastructure replacement as part of unplanned forced outages with a total $7,626,633 between January 1, 2020, and October 31, 2025. These are typically associated with damage during weather events or vehicle accidents. These costs include installation of infrastructure such as distribution poles, transformers and conductor.

Q119. ARE THE COSTS OF THE NEW MEXICO DAMAGE REASONABLE AND NECESSARY TO PROVIDE SAFE AND RELIABLE SERVICE TO CUSTOMERS?

A. Yes. The investments were necessary to reliably replace damaged infrastructure and restore service to customers. All the infrastructure is used and useful as well.

5. RELAY UPGRADES NEW MEXICO DISTRIBUTION SUBSTATIONS

Q120. WHAT IS BLANKET PROJECT DN015 NEW MEXICO DISTRIBUTION DAMAGE BLANKET?

A. The blanket project is for the replacement and upgrade of protection control equipment in New Mexico distribution substations with a total $5,064,119 between

January 1, 2020, and October 31, 2025, including relay upgrades necessary for EPE to comply with the minimum load feeder reporting associated with the New Mexico distributed generation hosting rule. Additionally, this equipment provides real time data and responses to system conditions, which is improves system reliability. Finally, the relay upgrades improve performance and protection coordination on the distribution system resulting in improved reliability.

Q121. ARE THE COSTS OF THE NEW MEXICO DAMAGE REASONABLE AND NECESSARY TO PROVIDE SAFE AND RELIABLE SERVICE TO CUSTOMERS?

A. Yes. The investments were necessary to comply with the New Mexico rule reporting requirement for minimum feeder load, replace aging relays and improve reliability of service. All of the relays are used and useful as well.

6. ADDITIONAL NEW MEXICO DISTRIBUTION CAPITAL PROJECTS

Q122. WHAT OTHER NEW MEXICO DISTRIBUTION PROJECTS WITH COSTS GREATER THAN $1 MILLION ARE INCLUDED IN THIS RATE CASE?

A. My Exhibit OAG-6 presents New Mexico distribution projects and their associated costs with project descriptions for all special projects with a cost greater than

$1 million but less than $5 million; the exhibit also presents Distribution blanket projects over $1 million but less than $5 million. Distribution blanket projects are standing projects that are utilized to cover smaller, recurring initiatives that arise such as substation equipment replacement identified during inspections or due to forced outages. Another area of investment is from reliability improvements to meet changing NERC Reliability Standards. The Company uses Distribution Blanket Projects to account for capital costs that fall within pre-defined, recurring categories. Although the individual activities are recurring and comparatively small in nature, these projects span activities that apply to the entire distribution system. The specific work orders under the project delineate the task by location, customer, or other characteristics that facilitate both scheduling and accounting processes at EPE. These projects are necessary to (1) improve reliability of the distribution system, (2) improve operation of the distribution system, and (3) meet EPE's continuous customer load growth.

The capital investment associated with most blanket projects are, in large part, customer-driven investments and net of any Contribution in Aid of Construction ("CIAC") made by the customer. These represent reasonable, necessary, and prudent capital investments that are used and useful to serve New Mexico customers.

Q123. ARE THE COSTS OF ALL THE NEW MEXICO DISTRIBUTION SUBSTATION PROJECTS LISTED IN MS. PRIETO'S EXHIBIT CSP-2 REASONABLE AND NECESSARY TO PROVIDE SAFE AND RELIABLE SERVICE TO CUSTOMERS?

A. Yes. The costs are reasonable, necessary, and prudent to provide safe and reliable service. The distribution substation projects are necessary to serve anticipated load growth, improve overall reliability and functionality of EPE's system, adhere to applicable reliability standards, and are subject to EPE's procurement processes and procedures to ensure the reasonableness and prudence of the costs. All of the projects are used and useful as well.

VII. T&D OPERATIONS AND MAINTENANCE

A. TRANSMISSION OPERATIONS AND MAINTENANCE

Q124. HOW MUCH IS INCLUDED IN TEST YEAR PERIOD O&M EXPENSE FOR TRANSMISSION?

A. O&M expense in the Test Year Period for transmission on a total Company basis is $29,603,190, as adjusted and as presented in the testimony of EPE witness Sierra and listed in Schedule H-01. EPE witness Hernandez supports the New Mexico jurisdictional transmission O&M in the amount of $6,872,008.

Q125. WHAT ACTIVITIES CREATE TRANSMISSION O&M EXPENSE?

A. The transmission O&M expense consists primarily of the cost of employees operating the transmission system and associated materials and services necessary and reasonable for maintaining the system, including vegetation management, repair work, replacement, and general upkeep.

Q126. DOES EPE HAVE COST CONTROL MEASURES IN PLACE TO MANAGE ITS TRANSMISSION O&M COSTS?

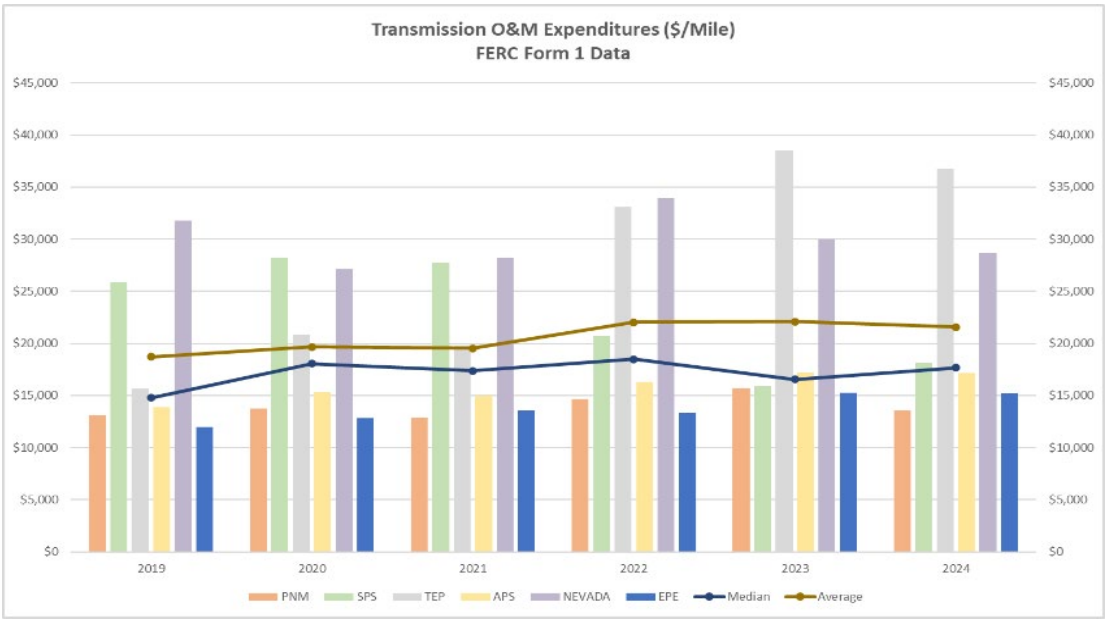
A. Yes. There are two major cost control mechanisms in place to manage these costs. As with the Energy Delivery capital projects, materials and services for transmission O&M projects are solicited through a formal competitive bidding process. Transmission O&M projects are subject to the same processes for obtaining competitive bids as I described previously. The expense also goes through a budgeting process that requires management approval. EPE has reasonable measures in place to manage these costs, and the costs for the Test Year Period are reasonable.

Q127. HOW DOES EPE'S TRANSMISSION O&M EXPENSE COMPARE TO OTHER REGIONAL UTILITIES IN RECENT YEARS?

A. The figures below illustrate EPE's comparative transmission O&M cost per mile of

transmission line with those of the other regional utilities (SPS, PNM, and TEP).

Figure OAG-4



Q128. DOES A FAVORABLE COMPARISON OF EPE'S TRANSMISSION O&M COSTS TO OTHER REGIONAL UTILITIES PROVE THAT EPE'S COSTS WERE REASONABLE AND NECESSARY?

A. Not by itself. Each company faces its own unique circumstances. A favorable comparison would simply show that EPE's efforts achieved results for its customers that are within the range of the other utilities' transmission costs, which they are. As I have discussed above, the facts show that EPE has cost control processes in place to allow it to effectively manage its transmission operations and to provide

reliable electric service to its retail customers, which in part can be demonstrated by the relatively low swings in EPE's O&M costs over the years. Accordingly, the transmission O&M costs EPE incurred during the Test Year Period should be found reasonable and necessary.

B. DISTRIBUTION OPERATIONS AND MAINTENANCE

Q129. WHAT IS THE TEST YEAR PERIOD O&M EXPENSE FOR DISTRIBUTION?

A. The total Company distribution O&M expense for the Test Year Period is $31,482,441 which includes adjustments presented by EPE witness Sierra and listed in Schedule H-01. EPE witness Hernandez supports the New Mexico direct assigned O&M expense for distribution of $8,240,915.

Q130. WHAT ACTIVITIES ARE INCLUDED IN DISTRIBUTION O&M EXPENSE?

A. Total distribution O&M expense consists of the cost of (1) employees operating the distribution system and any associated materials and equipment and (2) maintaining the system, such as vegetation management, repair work, replacement, and general upkeep.

Q131. DOES EPE HAVE COST CONTROL MEASURES IN PLACE TO MANAGE DISTRIBUTION O&M COSTS?

A. Yes. There are two major cost control mechanisms in place to review and manage these costs. Materials of value over $150,000 for distribution O&M projects are solicited through a formal competitive bidding process. Distribution O&M projects are subject to the same processes for obtaining competitive bids as I described earlier for distribution capital projects. The expense also goes through a budgeting process that requires management approval. This process helps to ensure that the Test Year Period distribution O&M costs are reasonable.

Q132. HOW DOES EPE'S DISTRIBUTION O&M EXPENSE COMPARE TO OTHER REGIONAL UTILITIES IN RECENT YEARS?

A. The chart below illustrates EPE's comparative O&M cost per customer served with those of the other regional investor-owned utilities, Southwestern Public Service ("SPS"), Public Service Company of New Mexico ("PNM"), and Tucson Electric Power ("TEP"), Arizona Public Service ("APS"), and Nevada Energy ("NV").

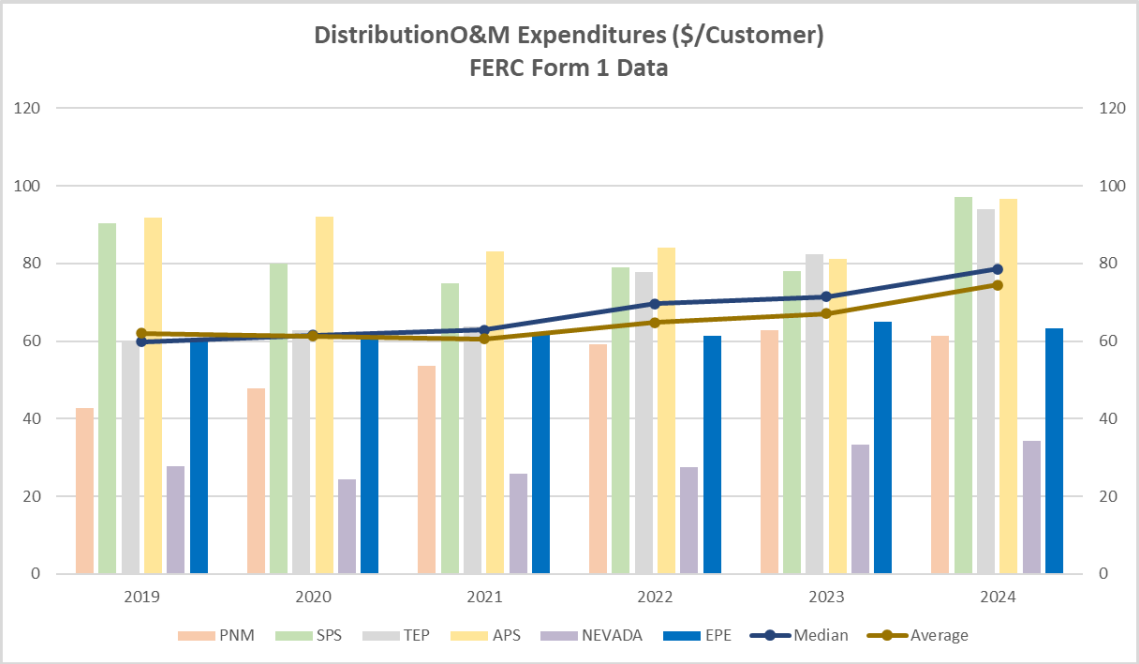
/

/

/

/

Figure OAG-5



Q133. DOES A FAVORABLE COMPARISON OF EPE'S DISTRIBUTION O&M COSTS TO OTHER REGIONAL UTILITIES PROVE THAT EPE'S COSTS WERE REASONABLE AND NECESSARY?

A. Not by itself; each company faces its own unique circumstances. A favorable comparison simply shows that EPE's efforts achieved results for its customers that are within the range of the other utilities' distribution costs. And, as I have discussed above, the facts show that EPE has cost control processes in place to allow it to effectively manage its distribution operations and to provide reliable electric service to its retail customers. Accordingly, the distribution O&M costs

EPE incurred during the Test Year Period should be found reasonable and necessary.

VIII. OTHER ITEMS

A. LEGACY METER PLANT

Q134. FOR CONTEXT, WHY IS LEGACY METER PLANT INSTALLED AFTER DECEMBER 2019 AN ISSUE IN THIS RATE CASE?

A. The AMS Case addressed stranded costs related to legacy meter plant that was in base rates at that time. The parties to that proceeding agreed that stranded costs related to any additional legacy meter plant investment, placed in service after the base year period for EPE's last rate case ending December 31, 2019 could be addressed in a future rate case filing. EPE witness George Novela provides additional detail regarding the AMS Project and the Commission approved Stipulation. Mr. Novela also presents and supports EPE's proposed ratemaking treatment for stranded costs related to legacy meters placed in service after December 31, 2019. My testimony is limited to the reasonableness of legacy meter capital investment after December 31, 2019.

Q135. WHAT IS EPE'S CAPITAL INVESTMENT IN LEGACY METER PLANT INSTALLED AFTER DECEMBER 31, 2019?

A. The New Mexico investment in legacy meter plant from January 1, 2020 through December 31, 2023 is $5,244,616.

Q136. WHY WAS THE INVESTMENT IN LEGACY METERS BETWEEN JANUARY 1, 2020 AND DECEMBER 31, 2023 REASONABLE AND NECESSARY?

A. The AMS Project was approved in November 2022 and EPE began mass deployment of AMS meters in New Mexico in the Fall of 2023.

First, it was reasonable and necessary for EPE to continue investing in and installing Legacy Meters during the approximately three years between the end of the last Base Period and AMS deployment during service calls for existing customers or for new customer services. The AMS meters require the AMS network for connectivity and billing data retrieval. The alternative of installing an AMS meter before there was an adequate mesh coverage would have increased metering costs for dispatching of technicians to manually retrieve billing data on a monthly basis because the AMS meters were not compatible with legacy meter drive by data retrieval.

EPE worked closely with contractors to establish a reliable and stable AMS mesh network across the entire service territory. However, while this work was in progress in 2023, it was at times necessary to install a legacy meter during service

calls for existing customers or for new customer services in areas where the AMS network was not yet fully operational due to insufficient meter deployment, which limited connectivity and functionality.

B. DISTRIBUTION LINE EXTENSION POLICY

Q137. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?

A. This section of my testimony supports EPE's proposed replacement to Rule 8 - Line Extension Policy. The replacement Line Extension Policy includes four substantive changes to protect EPE's existing New Mexico customers from potential costs of connecting large distribution customers. This section will first describe the need for those substantive changes and how the proposed changes protect existing customers while allowing for new large distribution customer connections. Given the current need for those four proposed changes, EPE took the opportunity to substantially update the structure and language of the Line Extension Policy to improve clarity. Other than the four previously mentioned substantive changes, the replacement Line Extension Policy does not introduce substantive policy changes or additional benefits to new connecting customers.

The proposed replacement Form 8 - Line Extension Policy (now formally titled Line Extension Policies and Construction Charges) is included in Advice Notice No. 317 and is also provided as Exhibit OAG-7.

1. FOUR PROPOSED CHANGES FOR PROTECTION OF CUSTOMERS

Q138. WHY IS EPE PROPOSING CHANGES TO ITS LINE EXTENSION POLICY RELATED TO LARGE CUSTOMERS?

A. Like many utilities around the country, EPE has recently experienced a significant increase in the number of service requests from or related to large loads (e.g., loads approaching or exceeding one megawatt, and in some instances, exceeding 10 megawatts). Some existing EPE customers have also requested or needed additional services for their own growing loads. While EPE works to ensure that the Company has the *generation* capacity to serve these new customer requests along with the Company's existing and projected customer load, the Company must also ensure that it has the *distribution and transmission* capacity to serve these new customer requests along with the Company's existing and projected customer load. This section of my testimony, therefore, discusses four scenarios that the Company has been experiencing in this context and describes the Company's proposed solution to address each scenario.

Q139. DESCRIBE THE FIRST SCENARIO AND EXPLAIN EPE'S PROPOSED SOLUTION OF A RESERVED DISTRIBUTION CAPACITY CHARGE.

A. One or more EPE customers with significant load have requested an additional

Primary Voltage line and related distribution facilities as a back-up to their regular main Primary Voltage line and related distributed facilities. To appropriately provide such service, EPE must ensure that the Company has distribution capacity reserved to serve both the customer's initial and alternate feeders. To avoid having other customers subsidize the costs of such reserved distribution capacity, it is reasonable that the requesting customer should be charged for the capacity reservation.

EPE therefore proposes, first, that any customer requesting an alternate Primary Voltage line shall either make a Customer Contribution in the amount of the Estimated Cost of the Primary Voltage Extension (including substation facilities) or enter into a written agreement to pay a monthly facilities charge equal to the Company's fixed charges on the additional facilities. See Section 3(E)(1) ("Dual Feeders.") Second, the proposed replacement line extension policy includes a provision that, if the alternate Extension requires a reservation of distribution capacity, requires the customer to be charged a Reserved Distribution Capacity Charge under the customer's applicable rate schedule, as further detailed by Company witness Rene Gonzalez. Please see Section 3(E)(1) ("Dual Feeders") of Exhibit OAG-7, which reflects the proposal.

Q140. DESCRIBE THE SECOND SCENARIO AND EXPLAIN EPE'S PROPOSED SOLUTION.

A. EPE has received requests to install facilities to provide service to speculative commercial or industrial developments[2] that plan to host a range of multiple large loads. This includes prospective manufacturing and small data center loads. For example, developers may request multiple 2,500 kVA transformers for one complex. For some context, one complex with four 2,500kVA transformers would consume the capacity of one distribution feeder (a 13.8 kV feeder has a 10 kVA capacity) or one-third of a substation transformer. Some of these loads may not come online for many months or may never materialize if a different type of tenant with lower consumption is ultimately attained. Therefore, the expectation of recovering costs to install or reserve capacity to serve these future loads through their payments for incurred electric services is uncertain. This creates a risk to the Company and its customers who may otherwise be responsible for these costs due to the premature acceleration of the construction of additional substation and transmission infrastructure. While some protection exists through existing credit requirements in the current line extension policy (i.e., provisions that a customer may be required to secure a Revenue Guarantee or otherwise have available funds to cover the Adjusted Revenue Obligation for line extensions), not all the costs of

[2] I am using the term "speculative" as it is used in the real estate industry to describe buildings under construction with no tenant yet identified.

reserving EPE distribution capacity for these customers may be covered by the guarantee, and other customers requesting service could be delayed due to the capacity reserved for these speculative loads.

To respond to these types of requests and improve protection for itself and its customers, EPE plans to impose controls for transformer size commitments upfront and proposes to add a new Distribution Capacity Reservation Charge to the Company's line extension policy and applicable line extension agreements for any customers that request to reserve the capacity beyond a twelve-month period. Upon any customer service request that requires a transformer greater than 750 kVA, EPE will request verification from the customer, including, if applicable, from the customer's certified electrician, of tenant status and type, and electrical load characteristics of planned equipment to assess planned Connected Load. Any requests from customers verifying planned Connected Load will be addressed under Section 3(B) of the proposed revised line extension policy including any applicable Customer Contribution requirements. If the customer does not verify planned Connected Load, EPE will provide at minimum a 750 kVA transformer, or a transformer sized to the verified load, and will reserve distribution capacity for the planned Connected Load for no more than one year after installation of the transformer. If the customer later verifies additional planned Connected Load, EPE will provide a larger kVA transformer as applicable but not exceeding the reserve

distribution capacity amount, and the customer will be managed going forward under Section 3(B) of the proposed revised line extension policy. However, if planned Connected Load requiring a larger transformer is not verified during the first twelve months after installation of the transformer, EPE will bill the Distribution Capacity Reservation Charge to any customer that requests to hold the reservation beyond the twelve-month period. The charge will be a one-time, non-refundable charge to reserve the requested capacity for an additional twelve-month period after which the reservation will terminate. It will be calculated as an annualized minimum demand charge based on the difference of the requested load and the install transformer capacity at the end of the initial twelve-month period. My Exhibit OAG-7 shows this proposal at Section 3(E)(4). EPE witness Rene Gonzalez's direct testimony provides an example of how the proposed charge will be calculated.

Q141. EXPLAIN THE THIRD SCENARIO AND DESCRIBE EPE'S PROPOSED SOLUTION.

A. EPE has received large load requests that, despite being at distribution voltage, would trigger the need to construct new transmission, substation and/or relay facilities (i.e., facilities energized at or above 69kV) due to their magnitude or unusual character. To respond to these types of requests and improve protection

for the Company and its customers, I first note that Section E.2 of EPE's existing line extension policy already includes the following provisions for primary and transmission voltage interconnections:

> Electric service from the Company's Primary and Transmission Voltage system is available, at the Company's option, to customers whose electrical load is of such magnitude or unusual character that it should not be served otherwise. The Customer shall be responsible for providing all transformation equipment, which must be in accordance with Company specifications. The total cost of the transmission line extension (including metering) shall be subject to a monthly facilities charge. The Company, at its option, may require a Customer Contribution for all or a portion of the Company's costs to construct the line extension.

EPE proposes to clarify the applicability of this section and include a new charge to protect the Company and its customers from potential adverse impacts.

Regarding applicability, EPE proposes that any customer seeking interconnection at distribution voltage for a 30,000 kW or higher load will be responsible for the costs of any unplanned substation upgrades, as well as transmission line upgrades, if applicable, that are required for the requested service (the transmission upgrades), as dedicated facilities. The 30,000 kW value is selected because it equates to the capacity of one substation power transformer for that customer. If the customer chooses that EPE install, operate and maintain the distribution facilities, the customer will be responsible for the costs of the transmission upgrades via an Infrastructure Capacity Charge and cost recovery guarantee that will be estimated at the time of the service request. The fee will be

based on the investment required to build out infrastructure to satisfy the needs of the development. The Company and the customer will enter into a written agreement addressing the cost recovery guarantee as well as the Infrastructure Capacity Charge and the period over which it will be paid. If the customer chooses not to move forward with their project, EPE will allow a refund of any unused funds towards construction efforts that had begun in good faith.

Regarding the new charge, EPE proposes a new Infrastructure Capacity Charge to the line extension policy and applicable line extension agreements. My Exhibit OAG-7 contains this proposal at Section 3(E)(5) ("Load Requests at Distribution Voltage for 30 MW or Greater") of the proposed replacement line extension policy.

Q142. DESCRIBE THE FOURTH SCENARIO AND EXPLAIN EPE'S PROPOSED SOLUTION.

A. EPE has experienced circumstances in which existing primary metering voltage customers as well as customers served from a distribution step-down transformer have increased their load significantly without the required notice to EPE under EPE's Second Revised Rule No. 13. When a customer that is served from a distribution step-down transformer increases load to the point that the transformer is overloaded, all customers served from that transformer may experience low

voltage and the transformer may fail, resulting in an extended outage. Similarly, primary customers that exceed the EPE-approved load might impact other customers that are served from the primary distribution line if the amount of added load results in an overloaded condition for the distribution line equipment.

EPE's Rule 13 in Section 2 (Rules and Regulations) of EPE's Tariff already addresses this issue to some extent. That rule is entitled "Increase of [sic] Decrease of Connected Load" and states:

> Customers shall not increase or decrease the connected load except upon notice to the Company, and in the event of any such increase or decrease, the customer shall pay for such increased or altered service at the Company's rates and minimum or guaranteed charges. The customer, if requested by the Company, will execute a new agreement at the Company's regular published rate covering the total connected load as increased.

Under Section 2 of EPE's Tariff, "Connected Load" means the combined nominal rated capacity in kilowatts of all motors or other electric energy consuming devices installed on the Customer's premises that may be operated with electric energy supplied by the Company. (See page 2 of Section 2, Sheet 2).

To improve the practical application of Rule 13 considering the increasing magnitude and impact of violations, EPE proposes to clarify the language of Rule 13 and identify disconnection of service as a possible penalty for failure to provide required notice to the Company. EPE also proposes to make Rule 13 more clear

and to conform it with the corresponding rule in our Texas service area. Please see Exhibit OAG-8 to my testimony for a copy of the proposed replacement Rule 13.

2. STRUCTURE AND LANGUAGE CHANGES

Q143. WHAT ELSE IS EPE PROPOSING IN THIS CASE WITH REGARD TO ITS LINE EXTENSION POLICY?

A. EPE's Line Extension Policy has not been substantially updated or revised in many years, with only minor modifications in 2021. With the passage of time, the Company's line extension policies in its two jurisdictions became more different in their organization and phrasing, although not in most material respects. In EPE's most recent 2025 Texas Rate Case, EPE updated its line extension policy to be make it easier to understand the requirements (and, as explained above, to address changes needed based on the four large customer scenarios) Since both the New Mexico and Texas line extension policies are materially the same, EPE is proposing language and structural changes that comports with the Company's recently updated Texas line extension policy. As a matter of administrative ease and efficiency, it makes sense for the Company to apply the same policy system-wide. It is therefore reasonable at this time to comprehensively revise and replace the New Mexico Line Extension Policy.

Q144. CAN YOU DESCRIBE THE NOTEWORTHY CHANGES MADE TO THE DEFINITIONS SECTION?

A. First, several new definitions were added, including definitions for the terms "notice," "Commission," "connected load," and "cost of capital charge," in order to improve clarity or because other changes to the Policy use those terms. New definitions were also added for the terms "revenue period," "revenue credit," and "revenue deficiency," Second, the definition of "adequate security" was removed, because it effectively has the same meaning as "revenue guarantee," a defined term in the Line Extension Policy. Third, several definitions were modified. The term "extension cost" was modified, for example, to be more specific about what costs are included in a line extension and what costs are not included. The definition of "revenue guarantee" was modified to specify the types of securities that are acceptable to the Company.

Q145. IN SECTION 3 (POLICIES), UNDER PARAGRAPH A(2), WHY WAS THE WORDING "IN A COST-CONSCIOUS MANNER WHILE ADHERING TO ALL APPLICABLE STATE AND LOCAL ORDINANCES" ADDED?

A. The wording "in a cost-effective manner while adhering to all applicable state and local ordinances" was added to ensure that while extending safe and reliable electrical facilities, the Company carefully considers all methods of construction

and builds in the most economic manner possible while adhering to all applicable ordinances.

Q146. IN SECTION 3 (POLICIES) UNDER PARAGRAPH B. (LINE EXTENSIONS) OPTION 1: LINE EXTENSION BUILT BY THE COMPANY 2. (REVENUE DEFICIENCIES) b. – 2 (REVENUE GUARANTEE ACCOUNT), WHY WAS THE WORDING "EPE MUST BE NOTIFIED BY THE ORIGINAL CUSTOMER IN ADVANCE" ADDED?

A. The wording "EPE must be notified by the original customer in advance" was added to guarantee that the customer responsible for the original line extension is given full credit for actual revenues of additional customers served from the original line extension within the allotted timeframe, after the cost of the additional line extension is covered. Due to the sheer number of new line extensions built by the Company yearly, it is difficult to track each line extension and correlate back to the original line extension. The Company is requiring that the customer of the original line extension notify the Company when additional line extensions are connected to receive the credit of additional revenue.

Q147. IN SECTION 3 (POLICIES) UNDER PARAGRAPH B. (LINE EXTENSIONS) OPTION 2: LINE EXTENSIONS BUILT BY THE

CUSTOMER 11. (REFUNDS FOR CUSTOMER BUILT LINE EXTENSIONS) b. - 3, WHY WAS THE WORDING "IF NOTIFIED BY THE CUSTOMER THAT BUILT THE ORIGINAL LINE EXTENSION IN ADVANCE" ADDED?

A. Like the changes I describe above, the wording "If notified by the customer that built the original line extension in advance" was added to guarantee that the customer that built the line extension is given full credit for actual revenues of additional customers served from the original line extension within the allotted timeframe, after the cost of the additional line extension is covered. Due to the sheer number of new line extensions constructed yearly, it is difficult to track each line extension and correlate back to the original line extension. The Company is requiring that the customer of the original line extension notify the Company when any additional line extensions are connected to receive the credit of additional revenue.

Q148. THE REVISED LINE EXTENSION POLICY REMOVES LANGUAGE THAT STATES THE COMMISSION'S RULE AT 17.5.410.27 NMAC. WHY IS THAT BEING REMOVED?

A. The line extension policy, at Section 3 (Policies), Section A (General) states that it is subject to all rules and regulations of the Commission. This includes 17.5.410.27

NMAC. Therefore, it is unnecessary for the line extension policy to merely re-state that rule.

Q149. PLEASE DESCRIBE ALL OTHER CHANGES REFLECTED IN YOUR EXHIBIT OAG-7.

A. The proposed replacement Line Extension Policy included in my Exhibit OAG-7 reflects the changes detailed above, such as using the new defined terms, or non-substantive clarifications to the existing language consistent with existing Company practices and to bring the Company's New Mexico and Texas line extension policies into conformance.

Q150. ARE EPE'S PROPOSED REVISED CHANGES TO THE LINE EXTENSION POLICY REASONABLE AND NECESSARY?

A. Yes, to achieve the purposes of the changes as described above, the revised Line Extension Policy proposed by the Company is reasonable and necessary.

IX. CONCLUSION

Q151. PLEASE SUMMARIZE YOUR CONCLUSIONS.

A. EPE's Test Year Period cost of service and capital investments for T&D Operations are reasonable and necessary to provide safe and reliable service. EPE requests the

additions to rate base of transmission capital investments in the total Company amount of $251.5 million ($55.6 million on a New Mexico jurisdictional basis) and $197.3 million for distribution capital investments in New Mexico. EPE's total Company transmission O&M expenses are $29.6 million, and distribution O&M expenses are $31.5 million. As supported in EPE witness Adrian Hernnandez's direct testimony, the New Mexico jurisdictional transmission and distribution O&M expenses are $6.9 million and $8.2 million, respectively. The Test Year Period costs are reasonable and necessary for safe and reliable service in New Mexico. All the distribution facilities I present in my direct testimony are in service, used, and useful. Additionally, EPE's proposed replacement to its Rule 8 Line Extension Policy and Rule 13 Increase or Decrease or Connected Load should be approved.

Q152. DOES THIS CONCLUDE YOUR TESTIMONY?

A. Yes, it does.

TL302 AIP Wood to Steel Project

Gila Forest Wildfire History Since 2020

- **Vics Peak Fire**
  - Area affected: 14,624 acres
  - Cause: lightning
  - Location: Sierra County
  - duration: 6/15/2020 - 8/4/2020
  - **Distance from fire to AIP transmission line: 12 miles**
- **Black Fire**
  - Area affected: 325,136 acres
  - Cause: Human
  - Location: Catron County, Grant County, Sierra County
  - duration: 5/13/2022 - 7/27/2022
  - **Distance from fire to AIP line: 6 miles**
- **Bear Trap Fire**
  - Area affected: 38,225 acres
  - Cause: undetermined
  - Location: Socorro County
  - duration: 5/1/2022 - 6/21/2022
  - **Distance from fire to AIP line: 24 miles**
- **Collins Fire**
  - Area affected: 3000 acres
  - Cause: undetermined
  - Location: Socorro County

  - duration: 4/7/2022 - 4/11/2022
  - **Distance from fire to AIP line: 7 miles**

- **Divide Fire**
  - Area affected: 26,514 acres
  - Cause: lightning
  - Location: Catron county
  - duration: 7/13/2023 - 8/4/2023
  - **Distance from fire to AIP line: 8 miles**

- **Davis Fire**
  - Area affected: 6,073 acres
  - Cause: lightning
  - Location: Catron county
  - duration: 7/15/2023 - 9/25/2023
  - **Distance from fire to AIP line: 6 miles**

- **Dolan Fire**
  - Area affected: 3,200 acres
  - Cause: lightning
  - Location: Catron county
  - duration: 7/30/2023 - 8/31/2023
  - **Distance from fire to AIP line: 1 mile**

- **Antone Fire**
  - Area affected: 12,397 acres
  - Cause: lightning

- Location: Catron county
- duration: 6/7/2024 - 6/24/2024
- **Distance from fire to AIP line: 6 miles**

- **Fisher Fire**
  - Area affected: 8130 acres
  - Cause: lightning
  - Location: Socorro county
  - duration: 7/1/2024 7/21/2024
  - **Distance from fire to AIP line: 25 miles**
- **Ridge Fire**
  - Area affected: 4257 acres
  - Cause: lightning
  - Location: Socorro county
  - duration: 7/1/2024 7/21/2024
  - **Distance from fire to AIP line: 21 miles**
- **Paramount Fire**
  - Area affected: 1335 acres
  - Cause: lightning
  - Location: Catron county
  - duration: 7/11/2024 7/27/2024
  - **Distance from fire to AIP line: 11 miles**
- **Buck Fire**
  - Area affected: 1335 acres

- Cause: lightning
- Location: Catron county
- duration: 6/11/2025 6/24/2025
- **Encroached and traversed 8 miles of the transmission line**

TL302 AIP Wood to Steel Structure Project Photos

Figure 1 represents the old wooden structures that run through the Gila National Forest. Wooden structures are the AIP (345kV Macho Springs-Springerville transmission line).

Figure 1

Figure 2 shows another view of a wooden structure through the forested area.

Figure 2

The next three photos (Figure 3-5) show the condition of some of the structures and the need to replace with steel structures to avoid failure.

Figure 3

Figure 4

Figure 5

Here are three photos (Figure 6-8) of the construction efforts to upgrade the wood structures to steel.

Figure 6

Figure 7

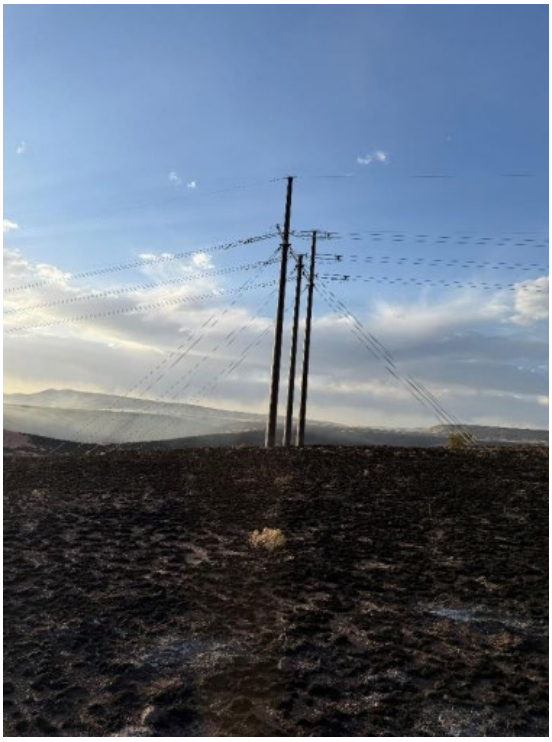

Figure 14

Transmission Special Projects Over $1M and Less than $5M		
PROJECT	**PROJECT DESCRIPTION AND BENEFIT**	**ADJUSTED TOTAL COMPANY GROSS ADDITIONS**
TL283	TXDOT PHASE 1 LOOP 375 XING UPGRADE - Project was required as part of a widening project of loop 375 roadway by TXDOT. Structures were replaced on four different transmission lines and increased in height to accommodate new highway infrastructure. Old wood H-Frame structures on both 345kV and 151kV lines were replaced with new steel structures, which increases reliability in our transmission system.	$ 4,032,267
TS156 [(1)]	ESCONDIDO 115KV NEW SUBSTATION AND TRANSMISSION LINE UPGRADES - Project part of a group of network upgrades required under the Service Agreement for Conditional Firm Point-To-Point Transmission Service for 65MW of solar power between EPE and Tucson Electric. The amount closed to plant in service is only network upgrade repayments credited to TEP's monthly ancillary services since COD through September 2024.	$ 4,185,010
TL282	TXDOT PHASE 1 LOOP 375 XING UPGRADE - Project was required as part of a widening project of loop 375 roadway by TXDOT. Structures were replaced on two different transmission lines and increased in height to accommodate new highway infrastructure. Old wood H-Frame structures on two 345kV lines were replaced with new steel structures, which increases reliability in our transmission system.	$ 3,597,258
TL193	LANE TO DIAMOND HEAD LINE (REBUILD) - This project is needed to provide additional capacity in an existing corridor with no new or expanded right-of-way options for linear infrastructure. The project included the replacement of fourteen transmission structures with taller steel structures to accomodate double distribution circuit underbuilds in the area.	$ 3,431,699
TL293	FABENS TO FELIPE TRANSMISSION LINE UPGRADES - A transmission system improvement project to reconductor, for additional capacity, the 69 kV transmission line between EPE's Fabens and Felipe substations.	$ 3,357,394
TL106	SPARKS-WRANGLER REBUILD - This project was identified as part of EPE's transmission expansion plan to upgrade conductor to 954 ACSR to increase line capacity and accommodate additional distribution line underbuild in existing right of way.	$ 3,068,900
TL299	18900 TROWBRIDGE - MARLOW TRANSMISSION LINE UPGRADE - This project is needed to provide additional capacity and line rating on the Marlow to Trowbridge 115kV transmission line. This included the replacement of old wood structures with taller steel poles and replacement of the conductor with 954 Rail ACSR.	$ 2,148,539
TL313	FE-5 TRANSMISSION LINE - Project was needed to connect a substation in our eastside service area to meet load growth. The structures installed to provide transmission service to this substation bisected the existing Sparks to Wrangler 115kV line.	$ 1,798,646

TS168	SUBSTATION SPARE AUTO TRANSFORMERS - This project was for the purchsae of one spare 115/69kV auto transformer. There were no spare 115/69kV auto transformers in the event an existing auto transformer failed and could not be brought back into service. An outage on any of our 115/69kV auto transformers would cause instability and outages along the transmission system. This spare auto transformer increases resiliency and reliability in our service area.	$	1,715,967
TL274	TRANSMISSION LINE ADJUSTMENTS FOR ROBERTS SUBSTATION - This project was required to as part of the generation expansion plan to connect Newman #6 unit to Roberts substation. It included connecting to the Newman-Pipeline and Newman-Picante 115kV lines.	$	1,566,496
TL254	TALAVERA TRANSMISSION LINE IN AND OUT RECONFIGURATION - This project was needed to connect a new substation, Talavera, to the 115kV transmission system. The project is related to growth in the area and included new structures to cut into the former Anthony-Arroyo 115kV transmission line, now the Anthony-Talavera and Talavera-Arroyo 115kv lines.	$	1,311,904
TL253	69KV WOOD POLE REPLACEMENTS ON GATEWAY - This project includes the replacement of 23 wood pole structures with steel structures. Wood pole structural assessments were completed in prior years and options to truss with steel bands were assessed. Due to the location of the poles next to highly trafficed areas, replacements with steel poles decreased safety risk to the public if a structure were to fail.	$	1,212,128
SS189	PHYSICAL SECURITY IMPROVEMENTS (CIP-014) - This project includes supplementing the existing security infrastructure at Luna substation with additional physical hardening and electronic security solutions. These improvements include installation of physical access control card readers, a new precast concrete wall, perimeter lighting, perimeter detection and supporting equipment.	$	1,209,675
TS175	MACHO SPRINGERVILLE TSS RELAY REPLACEMENT - Project increases reliability for our 345kV system by replacement of outdated technology used for line protection of the Macho Springs to Springerville 345kV transmission line.	$	1,194,651
TL316	LANE TO WRANGLER RECONDUCTOR - This project is needed to provide additional capacity and line rating on the Lane to Wrangler 115kV transmission line. This included the replacement of structures with taller steel poles and replacement of the conductor with 954 Rail ACSR to obtain a normal line rating of 165.3 MVA and emergency line rating of 219.7 MVA.	$	1,187,042
TL297	DALLAS TRANSMISSION LINE STRUCTURE REPLACEMENT - Project was required for the rebuild of Dallas substation to provide increased capacity in the area and increased reliability. It included the relocation and replacement of structures directly outside of the substation for line out of Dallas to Ascarate due to repositioning of the transmission line entry points to the substation. These structures were older wooden transmission structures and were replaced with new steel structures, increasing reliability of this line.	$	1,126,991

Transmission Blanket Projects Over $1M

PROJECT	PROJECT DESCRIPTION AND BENEFIT	ADJUSTED TOTAL COMPANY GROSS ADDITIONS
TL015	TRANSMISSION LINES IMPROVEMENTS AND UPGRADES - Blanket project used for recurring transmission line improvements. This includes steel channel additions, timber replacements, structure replacements resulting from inspections, and other capital investments related to transmission lines or corridors	$ 7,841,499
TS065	RELAY UPGRADES IN TRANSMISSION SUBSTATIONS - This blanket project is for the replacement and upgrade of protection control equipment in transmission substations. This equipment provides real time data and responses to system conditions, which is improves system reliability.	$ 5,827,425
TE100	EMERGENCY TRANSMISSION STRUCTURE REPLACEMENT - This blanket project contains emergency transmission structure replacements due to damage by the public, weather events, and aging infrastructure.	$ 5,544,304
TS063	TRANSMISSION SUBSTATION IMPROVEMENTS BLANKET - This blanket project maintains or improves transmission system reliability. It includes replacements or additions of transmission substation equipment and infrastructure, included but not limited to grounding grid, relay equipment, circuit breakers, switches, battery chargers, bushings, control house buildings, and security fencing.	$ 3,627,951
TP100	PALO VERDE TRANSMISSION BLANKET - Project is used to capture allocated capital costs associated with EPE's ownership of Palo Verde transmission assets.	$ 3,056,743
TT080	TRANSMISSION RIGHT OF WAY AND LAND ACQUISITION BLANKET - Blanket used for right of way (easements, land grants, etc.) renewal costs and costs related to new right of way and land parcel purchases which are not part of distribution projects.	$ 2,050,373
TH350	EASTERN INTERCONNECTION PROJECT CAPITAL BLANKET - Project needed to maintain or improve transmission system reliability. This blanket project is used for capital projects at Eddy Tie and Amrad substations and the transmission lines that connect them. Work included necessary equipment upgrades and replacement or upgrade of transmission structures.	$ 1,754,857
TH360	SOUTHWEST NEW MEXICO TRANSMISSION BLANKET – SHARED - Project needed to maintain or improve transmission system reliability. This blanket project is used for capital projects at Greenlee, Hidalgo, and Luna substations and the transmission lines that connect them. Work included necessary equipment upgrades and replacement or upgrade of transmission structures.	$ 1,609,522
	[(1)] Includes amounts closed to Plant In Service in October 2025	$ 67,457,241

Disribution Special Projects Over $1M and Less than $5M		
PROJECT	**PROJECT DESCRIPTION AND BENEFIT**	**ADJUSTED TOTAL COMPANY GROSS ADDITIONS**
DN164	MOONGATE (LE1) GETAWAY & FEEDERS - Project needed to maintain or improve system reliability and serve load growth in the area. It included the construction of new feeders from Moongate substation and feeder extensions to provide offload and back-feed support for Arroyo and Jornada feeders.	$ 3,322,304
DN178	TALAVERA SUBSTATION GETAWAYS AND FEEDERS - Project needed to maintain or improve system reliability and serve load growth in the area. It included the construction of new feeders from Talavera substation and feeder extensions to provide offload and back-feed support for Arroyo and Salopek feeders.	$ 2,197,341
DN226	GRID MOD NEW MEXICO SUBSTATION UPGRADES - Project needed to provide real time situational awareness of system conditions which improves system reliability. Upgrades of old electromechanical and solid state type technology to new microprocessor based relays on 28 New Mexico feeders. These new relays provide fault location, fault type, and fault current magnitudes along with increased system visability to our distribution operators.	$ 2,098,539
DN100	HATCH LINE REBUILD - Project needed to maintain or improve system reliability and serve load growth in the area. It includes the upgrade of ties between Hatch 20 and Picacho 20 to 795 AAC to provide offload and back-feed support.	$ 1,682,189
DN199	LAS CRUCES AIRPORT FEEDER EXTENSIONS AND BACKFEED - Project needed to maintain or improve system reliability and serve load growth in the area. It includes the installation of a feeder tie between Salopek 20 and Airport 21, and a tie between Picacho 20 and Airport 20 feeders to provide offload and back-feed support.	$ 1,634,750
DN198	JORNADA FEEDERS - Project needed to maintain or improve system reliability and serve load growth in the area. It included the construction of new feeders from Jornada substation and extensions of existing feeders to intercept Arroyo and Picacho feeders to provide offload and back-feed support.	$ 1,489,826
DN192	HATCH 21 REBUILD - Project needed to maintain or improve system reliability and serve load growth in the area. It includes the rebuild with 795 AAC to improve power flow from the 5 MW solar facility near the Uvas Valley, and flatten the voltage profile for the feeder.	$ 1,061,261

Distribution Blanket Projects Over $1M

PROJECT	PROJECT DESCRIPTION AND BENEFIT	ADJUSTED TOTAL COMPANY GROSS ADDITIONS
DN061 (1)	NEW MEXICO RESIDENTIAL CONSTRUCTION BLANKET - Needed to maintain or improve system reliability and serve load growth. Involves replacement or installation of overhead/underground distribution facilities to provide service to new residential customer installations and to provide additional load to existing residential customer installations.	$ 34,803,406
DN069 (1)	NEW MEXICO COMMERCIAL CONSTRUCTION BLANKET - Needed to maintain or improve system reliability and serve load growth. Involves replacement or installation of overhead/underground distribution facilities to provide service to new commercial/industrial customers installations and provide additional load to existing commercial/industrial customer installations.	$ 27,183,108
DN062 (1)	NEW MEXICO DISTRIBUTION BETTERMENT - Blanket project needed to maintain or improve distribution system reliability. Proactive replacement and upgrades of overhead and underground distribution equipment. This equipment includes, but is not limited to, pole top and pad mount transformers, poles, switches, and conductor.	$ 12,041,557
MN004	NEW MEXICO METERS BLANKET - Blanket project needed to maintain or improve system reliability and serve load growth. Replacement or installation of large residential and small and large commercial polyphase meters and primary metering equipment.	$ 8,676,912
DN065 (1)	NEW MEXICO DISTRIBUTION DAMAGE BLANKET - Reactive replacement of failed overhead/underground equipment due to damage by the public, weather events, and aging infrastructure.	$ 7,626,633
DN068	NEW MEXICO OVERHEAD SERVICE NEW AND/OR REPLACEMENT BLANKET - Blanket project needed to maintain or improve system reliability and serve load growth. Replacement and installation of wire and meters associated with new service hookups.	$ 5,610,946
DN015	RELAY UPGRADES NEW MEXICO DISTRIBUTION SUBSTATIONS - This blanket project is for the replacement and upgrade of protection control equipment in New Mexico distribution substations. This equipment provides real time data and responses to system conditions, which is improves system reliability.	$ 5,064,119
DN063	NEW MEXICO SUBSTATION BETTERMENT BLANKET - This blanket project maintains or improves distribution system reliability in New Mexico. It includes replacements or additions of distribution substation equipment and infrastructure, included but not limited to grounding grid, relay equipment, circuit breakers, switches, battery chargers, bushings, control house buildings, and security fencing.	$ 2,700,233
DN193	POLE REPLACEMENTS & IMPROVEMENTS NEW MEXICO BLANKET - Blanket project for the replacement or reinforcement of EPE owned pole based on below ground inspections. This project maintains and improves distribution system reliability.	$ 2,652,721

DN177	NEW MEXICO SUBSTATION 4KV CONVERSIONS - This project maintains or improves reliability in older parts of our New Mexico distribution system. It includes the replacement of older 4kV transformers, which have exposed primary and seconday terminators, with pad mount transformers that have equivalent load supplying capacity. Where it is not feasible to convert to a 4kV padmount substation, 4kv feeders are being converted to either 23.9kV or 13.8kV distribution when possible.	$	2,386,340
DN064	NEW MEXICO LIGHTING BLANKET - Blanket project for the replacement and installation of both area and street lighting infrastructure for New Mexico area customers.	$	1,946,875
DN222	NEW MEXICO 24KV FEEDER EXTENSION CONDUCTOR UPGRADES - Blanket project for the extension or reconductor of the 24kV distribution system in New Mexico as identified in the Distribution System Expansion plan. Project serves to improve or maintain distribution system reliability in New Mexico.	$	1,916,185
DN214	NEW MEXICO OVERLOADED TRANSFORMER REPLACEMENTS - Project supports increased loads driven by refrigerated air conversions and electric vehicle charging in residential areas across the New Mexico distribution system. Includes the identification and replacement of undersized line transformers.	$	1,446,848

(1) Includes amounts closed to Plant In Service in October 2025

EL PASO ELECTRIC COMPANY
SEVENTH REVISED RULE NO. 8
CANCELLING SIXTH REVISED RULE NO. 8

LINE EXTENSION POLICIES AND CONSTRUCTION CHARGES
X Page 1 of 31

SECTION 1 - PURPOSE

It is the purpose of this document to set forth uniform and comprehensive policies concerning Line Extensions and construction charges for the entire New Mexico service area of El Paso Electric Company ("Company")

SECTION 2 - DEFINITIONS

Actual Revenue means

The actual amount of revenue billed on account of the Line Extension by the Company from the Customer. The amount shall be based on monthly bills determined by the metered monthly kilowatt (kW) demand and kilowatt-hour (kWh) usage and by applying the appropriate tariff schedule and riders, less the fixed fuel factor costs and taxes.

Address for Notice means

Where notice is required to be provided to the Company under this Policy, such notice shall be sent via mail to:

El Paso Electric Company
ATTN: Distribution Design Supervisor
100 N. Stanton St.
El Paso, TX 79901
Location #571

OR sent electronically to:

DESIGNSUPERS@epelectric.com

Notice will be deemed received with a Notice Received email is sent to the Customer. If a Customer's email address is not provided to the Company, a Notice Received will be sent via mail.

Adjusted Revenue Obligation means

The Revenue Guarantee Obligation reduced by any Actual Revenue earned in any of the Revenue Period's twelve- (12-) month periods.

Cash Advance for Construction means

Advice Notice No. 317

Signature/Title /s/ James Schichtl
James Schichtl
Vice President – Customer and Regulatory Solutions

EL PASO ELECTRIC COMPANY
SEVENTH REVISED RULE NO. 8
CANCELLING SIXTH REVISED RULE NO. 8

LINE EXTENSION POLICIES AND CONSTRUCTION CHARGES
X Page 2 of 31

A cash advance by a Customer for construction that is subject to refund either wholly or in part, depending on the amount of Actual Revenue generated over the Revenue Period.

Commission means

The New Mexico Public Regulation Commission.

Completion Date means

The date that the Company has completed its portion of the work on the Line Extension to include any electrical work, which does not necessarily include energization of the Meter and service drop.

Connected Load means

The combined nominal rated capacity in kilowatts of all motors or other electric energy consuming devices installed on the Customer's premises that may be operated with electric energy supplied by the Company.

Construction Refund Cap means

The Company's design costs paid by the Customer plus the lesser of the Company's Estimated Extension Cost or the Customer's Company-approved actual costs for the construction of the Line Extension.

Cost of Capital Charge means

A charge calculated based on the Company's weighted average cost of capital (WACC) approved by the Commission in its last base rate case.

Customer means

Any corporation, business establishment, institution, association, governmental entity, or individual currently being served or using electric energy supplied by the Company.

Customer Contribution means

Either a Cash Advance for Construction or a Revenue Guarantee Account to cover a Revenue Deficiency.

Advice Notice No. 317

Signature/Title /s/ James Schichtl
James Schichtl
Vice President – Customer and Regulatory Solutions

EL PASO ELECTRIC COMPANY
SEVENTH REVISED RULE NO. 8
CANCELLING SIXTH REVISED RULE NO. 8

LINE EXTENSION POLICIES AND CONSTRUCTION CHARGES
X Page 3 of 31

Ending Revenue Deficiency means

The amount by which the Extension Cost exceeds Actual Revenue received from Customers served from the Line Extension at the end of the Revenue Period.

Estimated Annual Revenue means

The estimated revenue during any of the Revenue Period's twelve- (12-) month periods. The estimated revenue shall be calculated in a similar fashion as Estimated Revenue.

Estimated Extension Cost means

The Company's estimate of the Extension Cost calculated on the basis of current costs to install the same or a similar type of Line Extension.

Estimated Revenue means

The estimated revenue during the Revenue Period. The respective monthly kWh usage is determined by estimating the Customer's monthly demand, hours per day, days per week, and an average of 4.3 weeks per month, and calculated with the following formula:

kWh = kW * hrs * days * weeks

The above formula will be adjusted by a load factor and power factor, as applicable, based on the customer type and rate schedule for which the Customer qualifies. The monthly demand (kW) above is estimated based on operating and load information provided by the Customer and/or the average demand and operating characteristics of similar Customers.

The estimated revenue during the Revenue Period is determined by using the estimates of kWh and kW usage calculated by the above methods and applying the appropriate rate schedule and riders, less the fixed fuel factor costs and taxes.

Extension or Line Extension means

Either an Overhead Line Extension, Underground Line Extension (including a Line Extension for a backbone system), or Transmission Line Extension. A backbone system is the main line or "trunk" of a distribution feeder.

Extension Cost means

EL PASO ELECTRIC COMPANY
SEVENTH REVISED RULE NO. 8
CANCELLING SIXTH REVISED RULE NO. 8

LINE EXTENSION POLICIES AND CONSTRUCTION CHARGES
X Page 4 of 31

The actual cost to the Company for the design, installation, acquisition of permits, and any other necessary costs incurred for the construction of the Line Extension by the Company. The cost of the service drop, meters, and metering equipment is not included in the cost of an Overhead Line Extension except for those Customers served at one of the Company's standard Transmission Voltages. The cost of the meters and metering equipment is not included in the cost of an Underground Line Extension.

Franchised Area means

Those cities, towns, villages and counties in which the Company has been granted a franchise to provide electric utility service.

Impaired Clearance means

The condition where a structure(s), including, but not limited to, buildings, signs, towers, poles, fencing, and swimming pools, is located in a position or manner in which insufficient clearance, as specified by any applicable law, regulation, and local codes and the National Electric Safety Code, as may be amended, exists between the structure and the Company's existing transmission, substation, express feeder, streetlight or distribution line facilities or any combination thereof.

Line Extension Agreement means

The agreement entered into between the Customer and the Company based on this Policy in which either (1) the Company agrees to build a Line Extension in exchange for the Customer providing a Customer Contribution; or (2) the Company grants the Customer a Refund Credit, subject to any reductions or refunds as outlined in the Section 3 (Policies) under Paragraph B (Line Extensions), Option 2: Line Extensions Built by the Customer, Paragraph 11 (Refunds for Customer Built Line Extensions) in exchange for the Customer building the Line Extension.

Maximum Run means

The maximum amount of distance as determined by Company policy at the time of construction.

Meter means

A recording instrument of standard manufacture provided by the Company to measure energy consumption, demand, or both at a single Point of Delivery.

Overhead Line Extension means

EL PASO ELECTRIC COMPANY
SEVENTH REVISED RULE NO. 8
CANCELLING SIXTH REVISED RULE NO. 8

LINE EXTENSION POLICIES AND CONSTRUCTION CHARGES
X Page 5 of 31

The new pole line facilities (including, without limitations, poles, anchors, conductors, insulators, arresters, cut-outs, transformers, breakers and other miscellaneous hardware) necessary to provide electric service to the Point of Delivery.

Permanent Customer means

A Customer whose service is delivered to a Permanent Installation.

Permanent Installation means

Any structure that is constructed or placed on and permanently affixed to a foundation, and that is, or will be, used or occupied on a full-time basis. A manufactured home or a prefabricated structure shall qualify as a Permanent Installation if 1) the home or structure is installed on a foundation system according to regulations of the applicable city, county or state regulations or is otherwise impractical to move and has the wheels, axles and hitch or towing device removed and 2) the home or structure is connected to a permanent water and sewer system.

Point of Delivery means

The point where the Company's wires or facilities are connected with those of the Customer. For overhead service, the point specified by the Company where the Company's and the Customer's conductors are connected. For underground, see the Policies Section, Section C (Special Underground Service Provisions) Subsection A (Secondary Voltage Underground Extensions) Paragraph 2 (Point of Delivery).

Primary Service means

Electric service provided to a Customer at a Primary Voltage.

Primary Voltage means

One of the Company's standard voltages between 2,400 volts and 25,000 volts.

Revenue Credit means

The Estimated Revenue for the Revenue Period that can be used to offset the Customer's monthly bill.

Revenue Deficiency means

EL PASO ELECTRIC COMPANY
SEVENTH REVISED RULE NO. 8
CANCELLING SIXTH REVISED RULE NO. 8

LINE EXTENSION POLICIES AND CONSTRUCTION CHARGES
X Page 6 of 31

The amount by which the Estimated Revenue is less than the Estimated Extension Cost.

Revenue Guarantee Account means

An irrevocable letter of credit or certificate of deposit in a manner acceptable to the Company, and in an amount equal to the Adjusted Revenue Obligation. Such Adequate Security shall be obtained by the Customer from, or maintained by the Customer at, a financial institution that is acceptable to the Company, insured by the Federal Deposit Insurance Corporation or the National Credit Union Administration, and preferably located within the Company's service territory.

Revenue Guarantee Obligation means

The Estimated Extension Cost plus Cost of Capital Charges or, upon the final accounting for the Line Extension's construction, the Extension Cost as adjusted for Cost of Capital Charges.

Revenue Period means

The forty-eight (48) months that starts with the first month after the Completion Date for a Company-built Line Extension and after the closing of the sale of the Line Extension to the Company for a Customer-built Line Extension. The Revenue Period shall be divided into four separate 12-month periods, the first of which begins on the first full-billing month that begins after the Completion Date. The Revenue Period may be extended in accordance with Section 3 (Policies), Paragraph B, Option 1.2.b.2 Revenue Guarantee Account or Section 3 (Policies), Paragraph B, Option 2.11.c. for Customer-built Line Extensions.

Secondary Service means

Electric service provided to a Customer at a Secondary Voltage.

Secondary Voltage means

One of the Company's standard service voltages below 600 volts.

Temporary Service means

Electric service to a Customer that is not delivered to a Permanent Installation and, in the sole opinion of the Company, is otherwise not of a permanent nature (e.g., temporary sales stands or construction sites).

Transmission Line Extension means

New overhead Transmission Voltage facilities including, without limitation, poles, anchors, conductors, insulators, arresters, cut-outs, transformers, breakers, and other miscellaneous hardware necessary to provide electric service to the Point of Delivery.

Transmission Voltage means

One of the Company's standard voltages greater than or equal to 69,000 volts.

Underground Line Extension means

The new underground Primary or Secondary Voltage facilities including, without limitation, conduit system, pullboxes, transformer enclosure(s), transformer(s), primary voltage cables, secondary voltage cables, arresters, switches, cut-outs, pole risers and miscellaneous hardware necessary to provide underground service to the Point of Delivery.

SECTION 3 - POLICIES

A. GENERAL

1. The policies herein contained are subject to the terms and conditions in the Company tariff schedules, the rules and regulations of the New Mexico Public Regulation Commission, and the Company's standard operating procedures.

2. The Company will extend its facilities in a cost conscious manner while adhering to all applicable state and local ordinances. The Company will provide service in a uniform and nondiscriminatory manner to all Customers within its service territory under its standard applicable rate schedules and this policy. The Company will make Extensions within its territory required to serve any Customer on a basis equitable both to the Company and the Customer.

3. Meters:

   The Company will provide the Meter and designate the location of all Meters and metering equipment.

4. Type of Service:

   Either single-phase or three-phase electrical service shall be specified by the Company and service will be at one of the Company's standard voltages (i.e. Primary or Secondary Voltage). Customers requesting service must meet Company requirements.

5. Rights-of-Way (Easements):

   The Company will not construct a Line Extension for a Customer until the Company has secured all required rights-of-way and permits. All extensions shall be constructed on private rights-of-way, except for within Franchised Areas where Line Extensions may be constructed on existing public roads, streets, alleys or easements. New Customers shall grant such rights of way as required to the Company, without charge, over property owned or leased by said new Customers, and, if possible, will assist the Company in securing other rights-of-way necessary to provide service (by way of example, rights of way from a neighboring property owner). The Customer shall have all the Customer’s property corners surveyed and necessary property irons installed by licensed surveyors to permit the Company to properly install Company's electrical facilities within said rights-of-way.

6. If the Customer decides to cancel the request for a Line Extension, the Company shall have the right to recover all Extension Costs incurred by the Company until such cancellation. The customer shall secure a Revenue Guarantee Account or otherwise have available funds to cover the Adjusted Revenue Guarantee Obligation.

7. Renewable Energy and Distributed Generation Information:

   Upon request, the Company will provide information to the Customer requesting a Line Extension of the availability of information concerning on-site renewable energy and distributed generation technology alternatives. The Company shall provide a Customer with such information:

   a. At the same time the estimate of any required Cash Advance for Construction or other such prepayment is provided to the Customer, or

   b. Prior to the Customer signing a Line Extension Agreement if the Customer is not required to provide a Cash Advance for Construction or other such prepayment.

B. LINE EXTENSIONS

OPTION 1: LINE EXTENSIONS BUILT BY THE COMPANY

1. General:

   The Company will provide at its expense, Primary or Secondary Service to a Permanent Customer if the Estimated Revenue equals or exceeds the Estimated Extension Cost. No extension of overhead lines will be made from underground facilities or into areas designated or committed to underground facilities or into areas designated or committed to underground facilities. If the Company determines the Estimated Revenue from the Primary or Secondary Service Line Extension does not equal or exceed the Estimated Extension Cost, the Company shall be allowed to require a Customer Contribution for the Extension pursuant to the terms and conditions of this Line Extensions Policy.

2. Revenue Deficiencies:

   a. If the Estimated Revenue results in a Revenue Deficiency, the Company is not obligated to provide the Extension unless the Customer provides a Customer Contribution. The amount of the Customer Contribution shall be provided to the Customer and will be computed using the following formula:

(1)	Estimated Annual Revenue	$_____	
(2)	Estimated Extension Cost	$_____	
(3)	Revenue Credit, if any	$_____	(Line 1 x 4)
(4)	Customer Contribution	$_____	(Line 2 less Line 3)

   b. In cases of a Revenue Deficiency, the Customer must enter into a written agreement with the Company to cover the Revenue Deficiency through a Line Extension Agreement.

      (1) Cash Advance for Construction:

      The Customer may enter into a Line Extension Agreement for a term that commences when the Revenue Period commences.

         (a) Individual Customer Served:

         If the Extension is to serve an individual Customer, the Actual Revenue from the Customer shall be deducted from the Cash Advance for Construction for the Revenue Period, or until the amount advanced has

Advice Notice No. 317

Vice President – Customer and Regulatory Solutions

EL PASO ELECTRIC COMPANY
SEVENTH REVISED RULE NO. 8
CANCELLING SIXTH REVISED RULE NO. 8

LINE EXTENSION POLICIES AND CONSTRUCTION CHARGES
X Page 11 of 31

been exhausted. If a balance remains after the Revenue Period, the balance reverts to the Company as a Customer Contribution. All of the fixed fuel factor costs and taxes shall be paid monthly by the Customer.

(b) More Than One Customer Served:

If the Extension is to serve a group of Customers, refunds of the Cash Advance for Construction will be made annually based upon Actual Revenue received from Customers served by the Extension. If additional Customers are served from additional Line Extensions, refunds may be given as set forth in paragraph (d), which is below.

(c) Revenue Credit Given – Partial Cash Advance Required:

If the Customer is given a Revenue Credit, the Customer then may be required to make a Cash Advance for Construction for the Revenue Deficiency. Refunds will then be made only from Actual Revenue received from other Customers served when additional Line Extensions are constructed. Refunds or appropriation of the advance will be made as set forth in the following paragraph (d).

(d) $$R = \frac{E - C}{} \times (48 - M)$$, where:

R = the amount of the refund,
E = the Estimated Revenue from Permanent Customers served from additional Line Extensions,
C = the Estimated Extension Cost for the additional Extensions,
M = the number of months since the Completion Date.

Note that in no case will refunds from electric bill and one-time refunds exceed the Customer's Advance for Construction.

(e) The Company will reduce or waive the Customer Contribution when portions of a Line Extension are a service betterment for existing lines which constitute an upgrade or improvement that the Company would pursue even if the Customer had not requested the Line Extension.

Following the payment of a Customer Contribution, the Company will reconcile refund balances at the end of the first twelve (12) months of the Revenue Period and thereafter annually. The interest rate that will be applied

Advice Notice No. 317

James Schichtl
Vice President – Customer and Regulatory Solutions

EL PASO ELECTRIC COMPANY
SEVENTH REVISED RULE NO. 8
CANCELLING SIXTH REVISED RULE NO. 8

LINE EXTENSION POLICIES AND CONSTRUCTION CHARGES
X Page 12 of 31

to balances subject to refund will be the annual Commission-approved interest rate for customer deposits.

(2) Revenue Guarantee Account:

Customers may enter into a Line Extension Agreement for a term that commences at the beginning of the Revenue Period. At the end of the Revenue Period, the Company will determine if there is an Ending Revenue Deficiency. If there is an Ending Revenue Deficiency, Cost of Capital Charges will be assessed. The Ending Revenue Deficiency and the Cost of Capital Charges will then be due within thirty (30) days of billing.

If additional Line Extensions are to be connected to the original Line Extension, the Company must be notified in advance but no earlier than 30 days prior to such extension by the original customer at the Address for Notice. Thereafter, any Actual Revenue received from Customers served from the additional Extensions must first cover the cost of the additional Extension, including transformers, before it can be applied to the original Customer's Customer Contribution. When a Customer enters into a Revenue Guarantee to offset the Extension Cost, the Actual Revenue can come from the Customer entering into the Line Extension Agreement and other Customers who are later served from the Line Extension. If at the end of a Line Extension's term there is an expectation that the Actual Revenue will equal or exceed the Extension Cost within an additional two (2) year period, at the Company's option, the Line Extension Agreement's term may be extended by two (2) years.

The above terms related to Revenue Guarantee Accounts apply to individual residential Customers, commercial and industrial Customers, land developers, residential subdivision developers, and commercial and industrial subdivision/park developers.

EL PASO ELECTRIC COMPANY
SEVENTH REVISED RULE NO. 8
CANCELLING SIXTH REVISED RULE NO. 8

LINE EXTENSION POLICIES AND CONSTRUCTION CHARGES
X Page 13 of 31

OPTION 2: LINE EXTENSIONS BUILT BY THE CUSTOMER

1. General

Customers desiring new Line Extensions may choose to have the Extension constructed by a competent and qualified electrical contractor. After construction and acceptance, the Customer shall sell the Line Extension to the Company for $1.00 for its use in serving end-users.

Customers may choose to have only the underground structural portion of the Underground Line Extension constructed by a competent and qualified contractor. The underground structural portion of the Underground Line Extension includes all trenching, bedding, backfilling and required compaction, duct, concrete pullboxes, pull-box lids, Secondary Service enclosure, transformer pad and pullbox and transformer protection from vehicular traffic. After construction and acceptance by the Company of the structural portion of the Underground Line Extension, the Customer shall sell the underground structural system shall to the Company for $1.00 for its use in serving end-users.

In recognition of the need to protect the public from electrical hazards, and the need for structural and electrical systems which are useful and safely maintainable over a normal and customary service life, the following will govern the construction of customer-built electrical systems.

2. Design and Construction Specifications

The Company will design the Line Extension required to serve the Customer, in accordance with the Company's standards and specifications, and shall provide the design drawings and specifications to the Customer. The Customer shall pay the Company for applicable design costs at the time of the closing of the Line Extension sale, which are refundable to the Customer in accordance with this Option 2, paragraph 11.

3. Material Specifications

The Company shall specify all materials and equipment to be used in the Line Extension including, but not limited to, wire, cable, conduit, transformers, poles, fixtures, switchgear, relays, capacitors, and insulators. The Customer shall be free to acquire said materials from any source, provided that all materials shall be from Company-approved manufacturers and meet the specifications as promulgated by the Company that are in effect at the time the Company begins construction on the Line Extension.

James Schichtl
Vice President – Customer and Regulatory Solutions

EL PASO ELECTRIC COMPANY
SEVENTH REVISED RULE NO. 8
CANCELLING SIXTH REVISED RULE NO. 8

LINE EXTENSION POLICIES AND CONSTRUCTION CHARGES
X Page 14 of 31

4. Quality Control and Assurance

The Customer agrees to comply with Company specifications for materials, equipment, and construction standards. In order to assure compliance, the Company will select a construction inspector who will visit the construction site. The construction inspector shall have the authority to accept, or reject, the work and materials of the Customer or contractor and shall certify such acceptance or rejection at the time of inspection. The function of the construction inspector shall be to verify compliance with design, materials, equipment and installation specifications and all other matters relating to the quality control of the Line Extension construction.

The Customer agrees to pay the Company at the closing of the sale of the Line Extension for the Company's reasonable costs incurred in the inspection of the Line Extension. The inspection costs are refundable in accordance with this Option 2, paragraph 11.

5. Easements and Rights-of-Way

The Company will secure all required firm rights-of-way and permits for customer-built Line Extensions in accordance with Rights-of-Way (Easements) above located in the Policies Section under Paragraph A (General) 5, and the Customer shall pay the Company for all costs incurred by the Company for right-of-way acquisition. The Customer, at its option, can secure all required firm rights-of-way and permits. In this case, the following will apply:

a. The Customer shall provide to the Company easements and rights-of-way in a format approved by Company in its sole discretion, that reflects the as-built configuration and location of the Line Extension.

b. The Company will assist the Customer in securing rights-of-way necessary for the Extension, if requested. The Customer shall pay the Company for such assistance.

c. The Customer shall pay the Company for its reasonable costs incurred to verify the easements and rights-of-way. Right-of-way verification must be completed prior to closing of the Line Extension sale.

d. All right-of-way costs incurred by the Company shall be paid by the Customer at the time of closing of the Line Extension sale. Such rights of way are refundable in accordance with paragraph 11 of this Option 2.

6. Licensing Requirements and Compliance with Required Governmental Inspections

Advice Notice No. 317

The Customer shall only use those contractors who are properly qualified and licensed, in accordance with any applicable state and local law and regulation, to construct the Line Extension. The Customer shall also obtain from the contractor and transfer to Company at the closing of the sale of the Line Extension a one-year workmanship warranty as well as any standard equipment warranties for the Line Extension's components. The Customer agrees to comply with all applicable state and local construction inspection requirements.

7. Meters

The purchase and installation of Meters will be the sole responsibility of the Company.

8. Purchase of System and Resulting Tax Liability

After the Line Extension has been constructed, and accepted by the Company's construction inspector, the Customer agrees to sell to the Company and the Company agrees to buy the Line Extension for $1.00. This sale shall be free of any liens or encumbrances.

Should any gross receipts tax liability to the Company result from the sale, the Customer agrees to pay the cost of said tax liability.

The Company and the Customer shall execute an agreement (Customer-Built Line Extension) to transfer the property and to make the Customer eligible for refunds in accordance with paragraph 11 of this Option 2.

9. Property Records at the Time of Sale

The Customer agrees to supply to the Company its actual cost incurred in constructing the Line Extension so that proper accounting of the extension may be made by the Company. The Company will review the actual costs and may, at its sole discretion, request further documentation to support the submitted actual costs. Further, the Company may, at its sole discretion, reject such costs that after review it deems unreasonable. Those costs rejected by the Company shall reduce the Customer's total actual costs, which may affect the amount of the Construction Refund Cap. The Company agrees to keep the Line Extension costs incurred by the Customer confidential unless the Company is required to disclose this information to regulatory or other governmental agencies or bodies.

10. Liability for the Line Extension

Advice Notice No. 317

James Schichtl
Vice President – Customer and Regulatory Solutions

EL PASO ELECTRIC COMPANY
SEVENTH REVISED RULE NO. 8
CANCELLING SIXTH REVISED RULE NO. 8

LINE EXTENSION POLICIES AND CONSTRUCTION CHARGES
X Page 16 of 31

Commencing with the date of sale of the Line Extension to the Company, the Company will assume full and complete operating responsibility for the Extension. The Customer shall be liable for the direct and indirect consequences of any defects or failures of the Line Extension constructed by the Customer for a period of one (1) year from the date of acceptance, unless such defects or failures arise from the Company's design, specifications, or improper operation of the Extension.

11. Refunds for Customer-Built Line Extensions

a. At the time of sale of the Line Extension to the Company, the Customer may receive an initial refund payment based upon the installation of permanent Meters. The revenue refund payment is based on the Estimated Revenue from the Meters over the Revenue Period and cannot exceed the Construction Refund Cap. In such cases, the amount subject to refund will be computed using the following formula:

(1)	Construction Refund Cap	$_____
(2)	Total Revenue Credit for the Revenue Period (Estimated Revenue)	$_____
(3)	Amount Subject to Refund (Line 1 less Line 2)	$_____

The Customer must enter into a Line Extension Agreement with the Company to make the Customer eligible for refunds.

b. The Amount Subject to Refund will be refunded by the Company as follows:

(1) The Company will refund at the end of each Revenue Period's twelve- (12-) month periods to the Customer the Actual Revenue from such period above the Revenue Credit already given for the same twelve- (12-) month period or reduce the refundable portion by Actual Revenue from the twelve- (12-) month period below the Revenue Credit already given for such twelve- (12-) month period. At no time will the Company ever refund in total more than the Construction Refund Cap.

(2) The Company must review the account at the end of each of the Revenue Period's twelve- (12-) month periods. If at the end of a twelve- (12-) month period or the Revenue Period the total Actual Revenue exceeds the Construction Refund Cap, the Company must refund the entire amount subject to refund to the Customer.

(3) If notified, in advance, at the Address for Notice by the customer that built the original line extension, the Company will refund an amount equal to the Actual Revenue over the Revenue Period or the Estimated Revenue of each new customer connected to the customer-built Line Extension, less an amount equal to the Estimated Extension Cost of the additional Extensions, including transformers. No refund shall be made for Customers connected to a new Line Extension off the original Line Extension unless the new Extension and customers are within the area exactly described in the original Line Extension agreement. The total of all such refunds shall in no case exceed the Construction Refund Cap. Refunds will be made annually or at shorter intervals at the option of the Company.

c. If the Line Extension is generating sufficient revenue in the fourth (4^{th}) twelve-month period of the Revenue Period to cover the Company's fixed costs, the Company will extend the Line Extension Agreement for an additional two (2) years.

C. SPECIAL UNDERGROUND SERVICE PROVISIONS

A. Secondary Voltage Underground Extensions:

1. Permanent New Residential Customers:

(1) Overhead System:

Where 120/240 volt service is readily available from an existing overhead system, the Company will install, own, and maintain a pole riser, riser base, secondary service enclosure, and service conductors up to the Maximum Run for providing single phase underground secondary service to a Customer. The cost of installing the service enclosure and the pole riser installation shall be borne by the Customer. The Customer will supply, install, own, and maintain the conduit system from service enclosure to the Meter enclosure. The Customer-supplied conduit system must meet Company specifications and local code requirements.

(2) Underground System:

Where 120/240-volt service is readily available from an existing underground system, the Company will install, own, and maintain service conductors up to the Maximum Run for single phase service, in a customer supplied, owned, and maintained conduit system, from the nearest Company transformer or service enclosure to the Point of Delivery. The location of both points will be designated by the Company. The Customer-supplied conduit system must meet Company specifications and local code requirements.

2. Point of Delivery:

The Point of Delivery for individually served and metered residential Permanent Customers requesting underground service shall be the Meter enclosure.

When multiplex residential units (duplex and above) have their Meters grouped and connected into a common gutter, the Point of Delivery shall be at a Company-owned Secondary Service enclosure or transformer as designated by the Company.

The Point of Delivery for all other Customers requesting underground service shall be the low voltage terminals of the Company's transformation unless another Point of Delivery is specified by the Company.

Customers will provide, own, and maintain all facilities beyond the Point of Delivery.

CANCELLING SIXTH REVISED RULE NO. 8

LINE EXTENSION POLICIES AND CONSTRUCTION CHARGES
X Page 19 of 31

3. Residential Subdivisions:

In a residential subdivision, normally Underground Line Extensions must be made before construction of houses begins. The Company will install an underground distribution system in a filed, dedicated subdivision after the developer has met Company requirements pertaining to the installation of other utilities and has entered into a Line Extension Agreement covering the number of residential lots to be served, the location of any necessary overhead express feeder lines, the Revenue Guarantee Obligation, the Adequate Security, and other necessary conditions as determined by the Company. The developer's Revenue Guarantee Obligation for an underground residential system will be determined using then-current material and construction costs.

No overhead or underground Secondary Voltage services will be extended from the overhead express feeder lines.

4. Commercial and Industrial Customers:

The Company will install an underground Primary Voltage or Secondary Voltage Extension to serve a commercial or an industrial Customer after the Customer has entered into a Line Extension Agreement (if needed) covering the location of the Company's new Overhead and Underground Extensions, the amount of the Revenue Guarantee Account, if applicable, and the method of securing payment of the Revenue Guarantee Account. Commercial areas designated or committed to underground facilities by the Company and/or the developer or any regulatory body will only be served underground.

Commercial and industrial customers will provide, own and maintain all facilities beyond the Point of Delivery for both overhead and underground service.

5. Conversion of Overhead Facilities to Underground Facilities:

a. Residential Service Drops:

If a residential Customer requests conversion of the Customer’s existing overhead service drop to underground service; the Company will, at the Customer’s expense, install underground service conductors up to the Maximum Run if the following four (4) conditions are met:

(1) The Customer supplies and installs the pole riser, riser base, Secondary Service enclosure, and any conduit between the riser base and the service enclosure. After the installation of the above facilities, the Company will

LINE EXTENSION POLICIES AND CONSTRUCTION CHARGES
X

assume ownership and maintenance of these facilities. The customer must also grant any needed firm easements for this installation and for future Underground Line Extensions from the service enclosure to adjacent lot(s) as required.

(2) The customer supplies, and installs, owns and maintains the conduit system from the riser base or service enclosure to the Meter enclosure. The conduit system must meet Company and local code requirements.

(3) The customer makes any changes to the Customer's own service entrance equipment necessary to accommodate the new underground service.

(4) The Customer pays the Company the then-current estimated cost to install and remove the overhead service drop.

The cost of installing the service pedestal and the pole riser installation shall be borne by the Customer and the Company shall own and maintain the service pedestal and the pole riser installation.

B. Primary Voltage Distribution Facilities

If the Company, in response to a Customer request, agrees to replace the Company's existing overhead facilities with underground facilities, the Customer shall pay the Company in advance the estimated installed cost of the Company's new underground facilities plus the estimated cost to remove the existing overhead facilities less the estimated salvage of the removed overhead facilities.

Commercial and industrial customers will provide, own, and maintain all facilities beyond the new Point of Delivery.

EL PASO ELECTRIC COMPANY
SEVENTH REVISED RULE NO. 8
CANCELLING SIXTH REVISED RULE NO. 8

LINE EXTENSION POLICIES AND CONSTRUCTION CHARGES
X Page 21 of 31

D. TEMPORARY SERVICE

A Customer requesting Temporary Service shall pay the Company in advance the estimated cost of equipment plus installation and removal expenses, less the estimated salvage value. The cost of the equipment plus installation shall be calculated in the same manner as for permanent service. The removal expenses will be estimated based on the specific equipment and installation used for the Customer and the most current standard labor cost estimates. Salvage value will be based on the specific equipment and the market value of the equipment at the time the estimate is provided.

E. SPECIAL SERVICES

1. Dual Feeders:

   Any customer requesting an alternate Primary Voltage line in addition to the regular main Primary Voltage line shall either make a Customer Contribution in the amount of the Estimated Cost of the Primary Voltage Extension (including substation facilities),or enter into a written agreement to pay a monthly facilities charge equal to the Company's fixed costs on the alternate Extension. To the extent that the alternate Extension requires a reservation of distribution capacity, the Customer will be charged a Reserved Distribution Capacity Charge, as provided in the Customer's applicable rate schedule.

2. Transmission Voltage Service:

   Electric service from the Company's Transmission Voltage system is available at the Company's option to customers whose electrical load is of such magnitude or unusual character that it should not be served otherwise. The Customer shall be responsible for providing or funding all transformation equipment, which must be in accordance with Company specifications. The total cost of the transmission Line Extension (including metering) shall be subject to a monthly facilities charge. The Company, at its option, may require a Customer Contribution for all or a portion of the construction cost of the Extension.

3. Private Security Lighting or Area Lighting:

   Dusk to dawn security lighting service is available in the Company's service area under the terms and conditions of the applicable tariff rate schedule. If 240-volt overhead service is readily available within the Maximum Run, the Company will install a standard fixture on an existing wood pole or new wood pole located as mutually agreed to by the Company and Customer. If 240-volt overhead service is not readily available within the Maximum Run, the Extension Cost will be borne by the Customer. All requests for service from an underground system must be negotiated separately with the Company, as this lighting service is not available in all underground situations.

   The Company retains the right to remove a security light if it is damaged or vandalized repeatedly.

4. Load Requests Greater Than 750 kVA:

   Upon any customer request for service that requires a transformer greater than 750 kVA, EPE will request verification from the customer including, if applicable, from the

customer's certified electrician, of tenant status and type and electrical load characteristics of planned equipment to assess planned Connected Load. Any requests from customers verifying planned Connected Load will be addressed under Section B of this line extension policy including any applicable Customer Contribution requirements. If the customer does not verify planned Connected Load, EPE will provide, at minimum, a 750 kVA transformer, or a transformer sized to the verified load, and will reserve distribution capacity for the planned Connected Load for no more than one year after installation of the transformer.

If the customer later verifies additional planned Connected Load, EPE will provide a larger kVA transformer as applicable but not exceeding the reserve distribution capacity amount, and the Customer will be managed going forward under Section B of this line extension policy.

However, if planned Connected Load requiring a larger transformer is not verified during the first twelve months after installation of the transformer, EPE will bill a Distribution Capacity Reservation Charge to any customer that requests to hold the reservation beyond the twelve-month period. The charge will be a one-time, non-refundable charge to reserve the requested capacity for an additional twelve-month period after which the reservation will terminate. It will be calculated as an annualized minimum demand charge based on the difference of the requested load and the installed transformer capacity at the end of the initial twelve-month period.

5. Load Requests at Distribution Voltage for 30 MW or Greater:

Any customer seeking interconnection at distribution voltage for a 30,000 kW or higher load will be responsible for the costs of any unplanned substation upgrades, as well as transmission line upgrades, if applicable, that are required for the requested service (the Transmission Upgrades) as dedicated facilities. If the customer chooses that EPE install, operate and maintain the distribution facilities, the customer will be responsible for the costs of the Transmission Upgrades via an Infrastructure Capacity Charge and cost recovery guarantee that will be estimated at the time of the service request. The fee will be based on investment required to build out infrastructure to satisfy the needs of the development. The Company and the customer will enter into a written agreement addressing the cost recovery guarantee as well as the Infrastructure Capacity Charge and the period of time over which it will be paid. If the customer chooses to not move forward with their project, EPE will allow a refund of any unused funds towards construction efforts that had begun in good faith.

F. PUBLIC STREET LIGHTING, FREEWAY LIGHTING AND TRAFFIC SIGNAL LIGHTS

1. Company-Owned Street Lighting:

Street lighting systems are normally installed, owned and maintained by the Company. Only Company-specified standard street lighting components are used in the installations. Street lighting service is available to all city, town, village, county and state governmental entities (hereinafter referred to as "City") and will be installed only after the appropriate installation and billing authorization is received by Company in writing. This lighting service is also available to public schools for street, parking, and area lighting. All lighting service will be provided and billed under the applicable rate schedules.

a. Lights Served from Overhead Lines:

In areas with overhead electric distribution lines, streetlights are installed on existing wood poles. If the desired location of the new light does not have an existing pole, the Company will install one additional pole for each streetlight at no cost. If additional facilities are required in order to provide service to the light, the City, state entity, or school shall pay the Extension Cost as a Customer Contribution.

b. Lights Served from Underground Facilities:

In areas with underground electric distribution lines, streetlights (including a standard wood pole) will be installed at a location designated by the City and agreed to by the Company. The Company will also install the underground conduit, service wire, and related facilities as needed. Where streetlights are requested to be served underground and are installed by the Company and the street light installation will be owned by the Company, the Customer shall make a Customer Contribution for the difference between the cost of the Underground Line Extension and the four-year estimated revenue if there is a difference. The Company will install street light poles only on streets or main thoroughfares that are paved and have curbs and gutters.

2. City-Owned Street Lighting:

If a City desires to own streetlights that are to be installed by the Company, the City shall pay the Company the total installed cost incurred by the Company. The Company will operate and maintain the lights under the applicable rate schedule (Note 1: not all rates include maintenance). If the City specifies the materials and installation standards, they must be agreed to by the Company.

EL PASO ELECTRIC COMPANY
SEVENTH REVISED RULE NO. 8
CANCELLING SIXTH REVISED RULE NO. 8

LINE EXTENSION POLICIES AND CONSTRUCTION CHARGES
X Page 25 of 31

a. Lights Served from Overhead Lines:

In overhead served areas, the Company shall install all requested lights and related facilities at the City's cost.

b. Lights Served from Underground Facilities:

In underground distribution areas, the Company or the City may provide and install the streetlights at the City's cost. If the City provides and installs the lights (or requires a third party to do so) the Company will not assume any responsibility for operation or maintenance until after the light is connected and in service. If the Company is asked to make a connection to a new City-installed light and is unable to do so because of a faulty installation by the City, a charge for the service call equal to the Company's actual cost will be made.

3. State or City- Owned Street or Freeway Lighting:

In Franchised Areas, the Company may contract with the City to operate and maintain street lighting installed and owned by the State of New Mexico. In some cases, the Company may contract with a county for Interstate Highway lighting only. In the absence of such a contract, electric service for State-owned street lighting systems shall be provided under the Company's standard practice for metered commercial services and billed under the applicable rate schedule. The same terms apply to State-owned traffic signals, sign lighting, etc.

4. Relocation of Street Lights:

Street lighting facilities will be relocated for the benefit or convenience of a Customer only when written approval of the new location is received from proper county or municipal authorities and when the Customer making the request bears all relocation cost.

5. Lights in New Subdivisions with Underground Electric Facilities:

If streetlights are to be installed in a subdivision, the locations shall be mutually agreed to by the City and the Company before the Company designs its underground distribution system. The necessary conduit shall be installed from the nearest Company power source location to the proposed light pole location at the time of the subdivision development. Payment for these costs will be negotiated between the parties.

6. General Information

If the City or school desires to convert an existing Company-owned mercury vapor fixture to a high pressure sodium vapor fixture or LED fixture, the City or school shall pay all the labor costs associated with the conversion and purchase the old mercury vapor fixture from the Company at the un-depreciated value.

G. REMOVAL AND RELOCATION

A Customer requesting the removal and/or relocation of Company facilities shall bear all costs incurred by the Company in completing the removal and/or relocation. Should a request involve providing electric service simultaneously to new or additional electrical loads, the cost incurred by the Company in completing the removal and/or relocation shall be combined with the estimated cost to provide service. This applies to the removal and/or relocation of Company facilities that will physically interfere with the development of a property or construction of a new building(s), but does not apply to the removal and/or relocation of Company facilities simply as a matter of preference or for aesthetic reasons. If removal and/or relocation causes operating problems for the Company or is objectionable to other parties, the Company may refuse to remove and/or relocate the facilities. Relocation of the Company facilities is contingent upon the Company's securing all necessary rights of way.

J. SALE OF COMPANY INSTALLED FACILITIES

The Company, in response to a Customer request, may, in its sole discretion, sell Company facilities, in place, as is, for the estimated replacement cost less depreciation on replacement cost, if:

(1) The facilities are solely for the purpose of serving the customer, and

(2) The Customer is changing or expanding his electrical facilities in a manner that will include the Company's facilities as an integral part of the Customer's facilities.

K. IMPAIRED LINE CLEARANCE

Any Customer who installs or constructs any permanent or temporary structure(s) that constitutes an Impaired Clearance of the Company's existing transmission, substation, express feeder, street light or distribution line facilities, or any combination thereof, shall bear all costs incurred by the Company in the reconstruction or relocation, or both, necessary to remove any and all Impaired Clearances. The customer shall notify the Company as soon as possible of any existing or anticipated Impaired Clearances. In accordance with Section 1(A) of Second Revised Rule 7 of the Company's New Mexico Rules and Regulations approved by the New Mexico Public Regulation Commission, the Company may discontinue utility service to a customer without prior notice in the event of a condition determined by the Company to be hazardous.

EL PASO ELECTRIC COMPANY
THIRD REVISED RULE NO. 13
CANCELLING SECOND REVISED RULE NO. 13

INCREASE OR DECREASE OF CONNECTED LOAD

X Page 1 of 1

Customers shall not increase the connected load except upon written notice to the Company. In the event of any such increase, the customer shall pay for such increased or altered service pursuant to the appropriate tariff schedule(s). If requested by the Company, the Customer will execute a new Agreement for the Purchase of Electric Service at the Company's regular published rates covering the total connected load as so increased. In all cases in which new facilities are required to serve the increased load, the Customer must execute a new Line Extension Agreement.

The Company's service conductors, transformers, meters and other devices used to supply electric energy to the Customer each have a definite capacity, and no addition to the Customer's Installed Connected Load thereto will be permitted until the Customer has secured the Company's consent. A violation of this rule makes the Customer liable for any damage resulting there from and can result in the disconnection of service if, in the judgment of the Company, the increased load that has been added without consent of the Company has damaged or may damage the Company's facilities. In case the Customer's Connected Load is decreased, it is the responsibility of the Customer to notify the Company, in writing, of such decrease before obtaining any benefit in rates from such decrease

EL PASO ELECTRIC COMPANY
TESTIMONY DIRECT OF
ENEDINA SOTO

I. INTRODUCTION AND QUALIFICATIONS

Q1. PLEASE STATE YOUR NAME, AND BUSINESS ADDRESS.

A. My name is Enedina Soto. My business address is 100 N. Stanton Street, El Paso, Texas 79901-1341.

Q2. BY WHOM ARE YOU EMPLOYED?

A. I am employed by El Paso Electric Company ("EPE" or "Company").

Q3. WHAT IS YOUR CURRENT POSITION WITH EPE?

A. I am the Manager of the Load Research & Data Analytics Department.

Q4. HOW LONG HAVE YOU BEEN EMPLOYED BY EPE?

A. I have been employed by EPE since March of 2010.

Q5. WHAT ARE YOUR DUTIES AND RESPONSIBILITIES AS MANAGER?

A. I am responsible for the economic forecasting and load research functions. I manage and direct the activities of the Load Research & Data Analytics Department, including the development of load research studies and reports, allocation factors, weather normalization, and the long-term customer, energy, and load forecasts.

Q6. PLEASE SUMMARIZE YOUR PROFESSIONAL EXPERIENCE.

A. After earning my master's degree, I was hired by EPE as a Load Research Specialist, where my responsibilities included the derivation of the energy and demand allocation factors, the design and implementation of load research samples, the design of the Residential Appliance Saturation Survey, and the completion of schedules for regulatory rate case filings. In 2020, I was promoted to Principal-Economist where my responsibilities included the development of the long-term energy, demand, and customer forecast, as well as the weather normalization model. Shortly thereafter, I was promoted to my current position as Manager of the Load Research & Data Analytics Department in 2021.

Q7. PLEASE BRIEFLY DESCRIBE YOUR EDUCATIONAL BACKGROUND.

A. I graduated from The University of Texas at El Paso with a Bachelor of Business Administration in Economics in 2008, and a Master of Science in Economics in 2010.

Q8. HAVE YOU PREVIOUSLY PRESENTED TESTIMONY BEFORE UTILITY REGULATORY BODIES?

A. Yes, I have filed testimony with the Public Utility Commission of Texas.

II. PURPOSE AND SUMMARY OF TESTIMONY

Q9. WHAT IS THE PURPOSE OF YOUR TESTIMONY IN THIS PROCEEDING?

A. The purpose of my testimony is to describe the load research function and its role in gathering the energy and demand data necessary for assigning costs to jurisdictions and to rate classes for the development of tariffs; describe and support EPE's proposed weather normalization adjustments; present and support the results of EPE's most recent system loss study; as well as to provide EPE's forecasted sales and demand. I also support two compliance issues: (1) the allocation factors assuming the reopening of Rate No. 07 - City and County Service to new customers and (2) the load data for Rate No. 42 – Experimental Electric Vehicle Charging Rate. The Company's current energy and demand forecast summary is provided in Exhibit ES-6.

Q10. WHAT SCHEDULES DO YOU SPONSOR?

A. I am sponsoring Schedules M-3, P-1, P-6, P-9, and Q-1.

/

/

/

III. LOAD RESEARCH

A. LOAD STUDIES

Q11. PLEASE DESCRIBE THE LOAD RESEARCH PROGRAM AT EPE.

A. EPE's Load Research & Data Analytics Department conducts census and sample studies of New Mexico and Texas customer energy and demand usage by rate class to estimate class coincident peak demand, maximum class demand, and non-coincident maximum demand. EPE witness Adrian Hernandez uses this data to allocate costs to jurisdictions and rate classes, and EPE witness Manny Carrasco uses this data to develop rates based on energy and demand usage.

Q12. CAN YOU DESCRIBE A CENSUS STUDY?

A. Yes. A census study, or a 100 percent-metered study, indicates that every customer in that rate class is being measured with an Interval Data Recorder ("IDR") meter or through EPE's Advanced Metering System ("AMS"). These studies are typically performed on single customer rate classes or rate classes with a low number of customers. For example, EPE's New Mexico Large Power Service rate has about 24 customers, all of which have either IDR or AMS meters. Load studies for rate classes that are based on a census study are shown on Schedule P-1(b). Data for census studies are shown in total form; there is no sampling error in developing the total class load. The census data presented in Schedule P-1(b) is based on calendar

month information. Therefore, due to differences between calendar months and billing months, the data will not exactly match billing data.

Q13. FOR WHICH EXISTING RATE CLASSES IN NEW MEXICO DOES EPE CURRENTLY UTILIZE A CENSUS STUDY?

A. New Mexico rate classes that are evaluated using a census study are as follows:

- Rate 09 - Large Power Service;
- Rate 10 - Military Research and Development Service;
- Rate 26 - University Service; and
- Rate 29 - Large Power Interruptible Service.

Q14. CAN YOU DESCRIBE A SAMPLE STUDY?

A. Yes. Sample studies are performed on rate classes that have a large number of customers. Historically, for these larger rate classes, it has not been economically feasible to install IDR meters on every customer. For example, the load study for the New Mexico Residential Service rate class is a sample study due to the large number of customers in the rate class. With over 97,000 New Mexico Residential customers as of September 30, 2025, it would not have been economically feasible to install IDR meters on all customers in this class. With the deployment of AMS (which was completed in 2025 in New Mexico), all sample studies for the Base

Period were estimated using data from the AMS meters. The adoption of AMS has increased the availability of data; however, there will always be missing data due to customer opt-outs and possible data loss. For this reason, EPE will continue to rely on sampling when developing load studies for the larger rate classes but will transition to using larger sample sizes and will leverage the available data. The sample study data is shown in Schedule P-1b.

Q15. HAS EPE EVALUATED THE FEASIBILITY OF TRANSITIONING FROM SAMPLE-BASED LOAD STUDIES TO POPULATION-BASED LOAD STUDIES FOR THE CURRENT RATE CASE?

A. Yes. A population-based approach would indicate that every customer in that rate class is included in the load study. EPE explored the feasibility of using a population-based approach by leveraging all available AMS data for the New Mexico jurisdiction for the Base Period. The analysis compared six key metrics between the two approaches: average energy per customer, average coincident demand per customer, average maximum class demand per customer, average non-coincident demand per customer, class load factor, and class coincidence factor. The comparison is provided in Exhibit ES-1. The analysis shows that the population-based approach is consistent with the traditional sample-based results.

Based on this analysis, EPE elected to continue using a sample-based

approach. This decision was made with confidence that the sample is representative of the population and offers advantages in terms of computational efficiency, reduced processing time, resource optimization, and transparency.

Q16. ARE THERE ANY CONCERNS WITH USING POPULATION-BASED LOAD STUDIES IN THE CURRENT BASE RATE CASE?

A. Yes. Because the AMS rollout had not been completed at the start of the Base Period, complete data is not available for all customers. Also, because AMS meters were installed by geographic region, entire neighborhoods may not be represented at various timeframes throughout the Base Period.

In addition, the Load Research team validates the data used in computing the sampled load studies. Reviewing and validating data for the entire population within a rate class is much more resource intensive.

Q17. WILL EPE USE POPULATION-BASED LOAD STUDIES IN FUTURE FILINGS?

A. Not at this time. As previously mentioned, due to customer opt-outs from AMS and possible data loss, full population data may not be available. However, EPE intends to leverage AMS data by incorporating the use of larger sample sizes to calculate the key metrics in its load studies for future filings.

Q18. FOR WHICH EXISTING RATE CLASSES IN NEW MEXICO DOES EPE CURRENTLY UTILIZE A SAMPLE STUDY?

A. The following rate classes in New Mexico are sampled:

- Rate 01 - Residential Service;
- Rate 03 - Small General Service;
- Rate 04 - General Service;
- Rate 05 - Irrigation Service;
- Rate 07 – City and County Service;
- Rate 08 – Water, Sewage, Storm Sewage Pumping or Sewage Disposal rate; and
- Rate 25 - Outdoor Recreational Lighting.

Q19. WHAT ARE THE PROCEDURES EPE USES TO DEVELOP A SAMPLE DESIGN?

A. EPE uses a stratified random sample process to develop the sample design. The stratified random sample process is composed of the Dalenius-Hodges stratification procedure and the Neyman allocation methodology. The Dalenius-Hodges procedure categorizes each customer into predetermined energy or demand blocks and calculates stratum boundaries based on the frequency of customers per block.

It is important that each customer selected for the sample is in the appropriate strata to ensure an accurate weighted average. The Neyman allocation method is then used to calculate the optimal sample size and to allocate samples between the strata. These methods make use of available data to build efficient and cost-effective sample designs.

Q20. WHAT DOES EPE DO TO COMPLETE THE DEVELOPMENT OF A SAMPLE STUDY AFTER IT IS DESIGNED?

A. After the steps described previously are completed, EPE randomly selects customers from each rate class being sampled and installs survey equipment at each customer's premises, which includes either an IDR or AMS meter. EPE's Meter Testing Department maintains the IDR meters and performs a monthly translation of the data. The Meter Testing Department screens data to ensure the accuracy and validity of the IDR meter readings. AMS data is validated by the Meter Data Management System ("MDMS") on a daily basis. The Load Research & Data Analytics Department performs data analysis on the interval data to identify possible data errors. Data within a normal tolerance range are used in the load study calculations.

For the analysis, a "typical customer" for each study is used for data comparison. The data for each account is collected on a continuous basis with IDR

meters read monthly. For AMS metering, residential meters are read every fifteen minutes and commercial meters are read every five minutes. The data is collected by the AMS system every four hours. After the data is validated, it is merged into the Load Research database which is updated every other day. Accounts in each stratum are then averaged, producing a stratum average. Each stratum average is then multiplied by the stratum weighting factor to develop the class weighted average. The strata weighting factors are the population customers in each stratum as a percentage of the total population for the entire rate class at the time the sample is designed. The weighted average represents a typical customer for each sampled rate class.

Q21. WHAT PROCESS DOES EPE USE TO KEEP THE LOAD STUDIES CURRENT?

A. EPE aims to re-stratify its sample studies and implement new samples every three to five years. The most recent samples were designed in the summer of 2023 and implemented in February 2024. Re-stratification uses the Dalenius-Hodges and Neyman Allocation techniques to derive a new sample design and select a new random sample for each sampled rate class. For the most current samples, AMS meters were installed instead of the usual IDR sample.

For census studies, the customer composition of each rate class is updated every month to ensure full representation.

B. DEVELOPMENT OF JURISDICTION AND RATE CLASS ALLOCATION FACTORS

Q22. HOW ARE ENERGY AND DEMAND BY JURISDICTION DETERMINED?

A. Energy for each jurisdiction is based on billed energy, adjusted for losses. For jurisdictional demand at the time of the native system peak, New Mexico load data are gathered from substations in New Mexico and along the Texas-New Mexico state line. The New Mexico load contribution for each substation is updated on an annual basis. The total coincident demand from New Mexico and EPE's wholesale customer, Rio Grande Electric Cooperative ("RGEC"), is subtracted from total system demand at time of peak to determine Texas coincident load. Maximum and coincident demand by rate class are determined by using billed energy and the estimated load and coincidence factors from the load studies. Energy and demand losses are applied in this model using the most current loss study.

Q23. DO THE ENERGY AND DEMAND ALLOCATORS NEED TO TAKE LOSSES INTO ACCOUNT?

A. Yes. Customers are served at different voltage levels and, therefore, have different losses associated with service. For proper allocation of costs, both energy and demand allocators take losses into account to appropriately reflect generation "at the source". EPE's latest loss study is used in the development of EPE's allocators and is further discussed in Section V of this testimony.

Q24. WHAT ADJUSTMENTS WERE MADE TO THE JURISDICTIONAL ENERGY AND DEMAND ALLOCATORS?

A. Generation from EPE's resources that are assigned to serve customers from a specific jurisdiction were directly assigned to the relevant jurisdiction and removed from the retail customers' energy and demand usage used in the jurisdictional allocators. For example, Newman Unit 6 is assigned to Texas, and the Carne Project is assigned to New Mexico. Please refer to the direct testimony of EPE witness Jeffery Hughes for EPE's generation resources and refer to the direct testimony of EPE witness Victor Martinez for a discussion of EPE's battery energy storage system resources.

Q25. WHY IS THE ADJUSTMENT FOR DEDICATED RESOURCES TO THE JURISDICTIONAL ENERGY AND DEMAND ALLOCATORS IN THE TOTAL COMPANY COST OF SERVICE STUDY APPROPRIATE?

A. The adjustment is appropriate because the costs associated with these generation resources are recovered from customers in specific jurisdictions and are directly assigned to the relevant jurisdiction in the jurisdictional costs of service study.

Q26. WAS A SIMILAR ADJUSTMENT MADE FOR ANY EPE OWNED DEDICATED GENERATION IN CASE NO. 20-00104-UT?

A. Yes. This adjustment was made to Holloman Air Force Base's ("HAFB") energy and demand usages to account for the solar photovoltaic facility that was built to serve HAFB's specific load. This adjustment was made in the same manner as solar resources that were built to serve a specific jurisdiction.

Q27. HAS EPE MADE ANY NOTEWORTHY CHANGES IN ITS ALLOCATION METHODOLOGY FROM ITS LAST NEW MEXICO BASE RATE CASE FILING IN CASE NO. 20-00104-UT?

A. Yes. EPE changed the billing determinants used in calculating the production and transmission allocation factors for distributed generation ("DG") customers.

Q28. CAN YOU DESCRIBES EPE'S HISTORICAL TREATMENT OF DG CUSTOMERS' BILLING DETERMINANTS IN THE CALCULATION OF

THE ALLOCATION FACTORS AND HOW THIS DIFFERS FROM THE CURRENT CALCULATION?

A. Yes, historically, EPE has made an adjustment ("DG Adjustment") to the per book billing determinants to account for the total energy delivered to DG customers rather than using net energy. Total energy delivered reflects the energy delivered by EPE to DG customers, while net energy is the difference between the energy delivered and the energy received by EPE from the DG customers. Historically, these adjusted billing determinants have been used in the calculation of the production, transmission, and distribution allocation factors.

For the current rate case, EPE did not include the DG Adjustment in its calculation of the production and transmission allocations factors but did include it in its calculation of the distribution allocators. Contrary to the historical treatment of DG customers' billing determinants, the current production and transmission allocators rely on DG customers' net energy as opposed to delivered energy.

Q29. WHY IS EPE USING NET ENERGY FOR DG CUSTOMERS IN THE CALCULATION OF THE PRODUCTION AND TRANSMISSION ALLOCATORS?

A. EPE is using net energy for DG customers because these customers produce a portion of the energy they consume, reducing the generation required to serve these

customers throughout the year and at the time of EPE's system peak. EPE's use of DG customers' net energy in the production and transmission allocation factors recognizes the customers' reduced energy consumption and contribution to the native system peak resulting from producing a portion of their own generation.

Q30. WHY IS THE ADJUSTMENT TO ACCOUNT FOR ENERGY DELIVERED TO DG CUSTOMERS APPROPRIATE IN THE CALCULATION OF THE DISTRIBUTION ALLOCATORS?

A. The adjustment is appropriate because distribution costs are a function of all energy delivered to each customer's service point regardless of the type of customer.

Q31. WHAT IS THE EFFECT TO THE JURISDICTIONAL AND CLASS ALLOCATORS OF USING NET ENERGY FOR DG CUSTOMERS IN THE PRODUCTION AND TRANSMISSION ALLOCATORS?

A. Using net energy instead of delivered energy for DG customers resulted in a change to both jurisdictional and class allocators. At the jurisdictional level, New Mexico saw a decrease in the E1Energy allocator, as well as decreases in all the demand jurisdictional allocators for both per book and adjusted allocation factors. At the class level, the use of net energy resulted in a decrease to the residential class energy and demand allocators. Changes to all allocators are shown in Exhibit ES-2.

Q32. DID EPE DEVELOP ANY SCENARIOS FOR THE ALLOCATION FACTORS?

A. Yes, EPE produced two scenarios for the allocation factors. Scenario 1 was developed to illustrate the effect of reopening Rate No. 07-City and County Service to new customers. EPE developed this illustrative set of class allocation factors to comply with the Commission Case No. 20-00104-UT Final Order, but it does not reflect EPE's proposal for this current base rate case. This alternative set of class allocation factors is displayed in Exhibit ES-3. EPE witness Mr. Hernandez uses these illustrative allocators in a cost of service study to comply with that final order regarding reopening Rate No. 07 to new customers.

In addition, EPE also developed a second scenario of allocation factors to support the large load tariffs presented by EPE witness Mr. Carrasco. These allocators are also found in Exhibit ES-3.

C. LOAD DATA AND LOAD PROFILE FOR ELECTRIC VEHICLE ("EV") CHARGING RATE

Q33. WHAT INFORMATION DID EPE AGREE TO PROVIDE FOR RATE NO. 42 – EXPERIMENTAL ELECTRIC VEHICLE CHARGING RATE ("RATE NO. 42") IN THE LAST RATE CASE?

A. EPE agreed to provide the following information:

- The maximum number of customers taking service under the rate schedule by rate class.
- The number of customers that have taken service under the rate schedule at any one time since implementation.
- The average bill for Rate No. 42 customers.
- The load data and the load profile of Rate No. 42 customers, including data on how EV charging load coincides with EPE's system peak.

The following two questions in my testimony address the load data and load profile requirement as well as the charging behavior at the time of EPE's system peak. All other requirements are addressed by EPE witness Rene Gonzalez.

Q34. DID EPE ANALYZE THE LOAD PROFILE OF CUSTOMERS ENROLLED IN RATE NO. 42?

A. Yes. EPE's Load Research & Data Analytics Department produces typical day profiles per month for customers enrolled in Rate No. 42 to better understand the energy consumption of these customers in addition to measuring the effectiveness of the rate to incentivize off-peak EV charging. The load study and load profiles for Rate No. 42 are provided in Workpaper ES-1. Figures ES-1 to ES-3 provide the average hourly profile for customers during the Summer (June-September),

Non-Summer Daylight Saving Time (March, April, May and October), and Non-Summer Standard Time (January, February, November, and December) months. Figures ES-1 to ES-3 show that the majority of customer EV charging occurs during the super off-peak and off-peak periods, effectively reducing demand during on-peak hours. All months show a distinct reduction in demand during the on-peak afternoon period, with the lowest demand occurring between approximately 2–4 PM, after which the demand starts to increase across all months. The pronounced reduction in on-peak demand, followed by a post-peak rebound, strongly suggests intentional load shifting away from on-peak hours.

Q35. DID EPE ANALYZE THE IMPACT OF EV CHARGING FROM CUSTOMERS ENROLLED IN RATE NO. 42 ON EPE'S NATIVE SYSTEM PEAK?

A. Yes. EPE's Load Research & Data Analytics Department produces load studies to analyze demand and energy consumption during system peak hours of customers enrolled in Rate No. 42. Figure ES-5 summarizes the average monthly energy per customer and the percentage of energy used during the on-peak, off-peak and super off-peak periods during the 4-CP summer months (June-September). Figure ES-6 shows the coincidence factor (percentage of the maximum demand with respect to the demand at the time of the system peak) per customer during the 4-CP summer months (June-September). Workpaper ES-1 provides the load study information for the Base Period October 2024 – September 2025.

The graphs indicate that customers enrolled in Rate No. 42 predominantly charge during off-peak and super off-peak periods across the summer months (June through September), with on-peak energy consumption comprising a relatively small portion of total usage. On-peak energy use remains limited to approximately 6.4–10.5% of total consumption during June through September. Off-peak periods consistently account for the largest share of energy consumption, ranging from approximately 52% to 58% of total energy use, while super off-peak periods

contribute an additional 34% to 40%. This distribution indicates sustained customer behavior aligned with time-of-day price signals.

The observed pattern reflects effective load-shifting behavior and demonstrates the continued ability of participating customers to manage usage in a manner that mitigates on-peak demand impacts. This load distribution is consistent with program objectives to reduce on-peak system impacts.

Figure ES-5 - Monthly Energy and the Percentage of Energy used During the On-Peak, Off-Peak and Super Off-Peak periods during the summer months (June-September) of the Base Period.

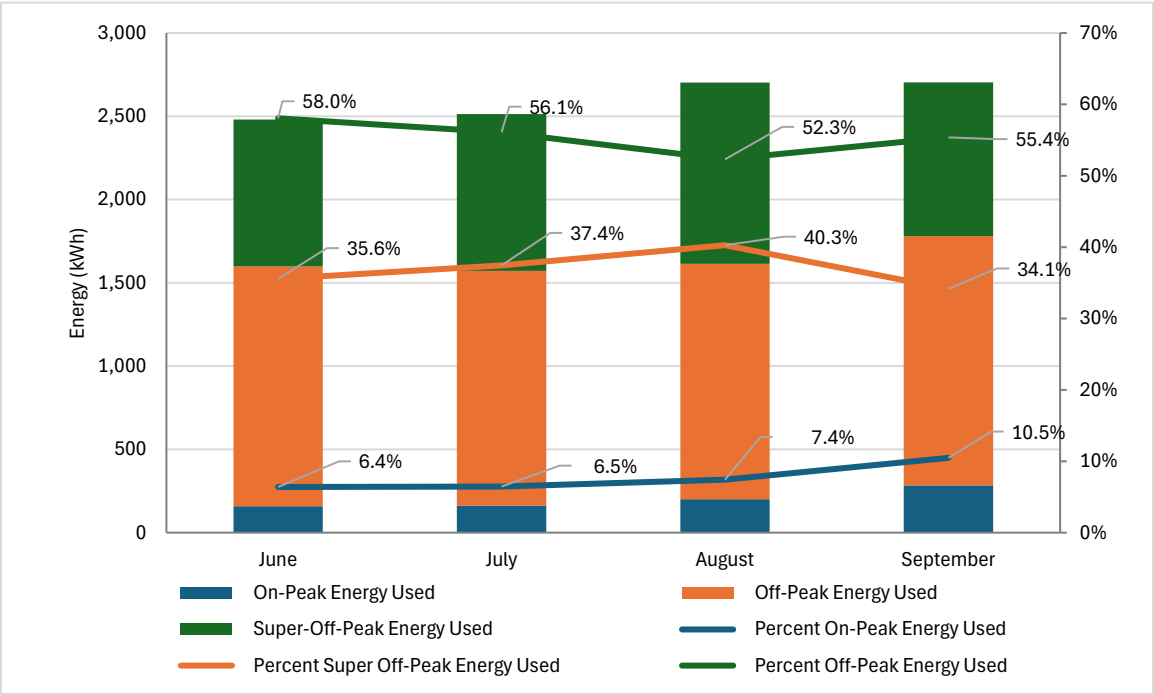

Figure ES-6 - Maximum Demand and Coincidence Factors Per Customer During the 4-CP Summer Months (June-September) of the Base Period.

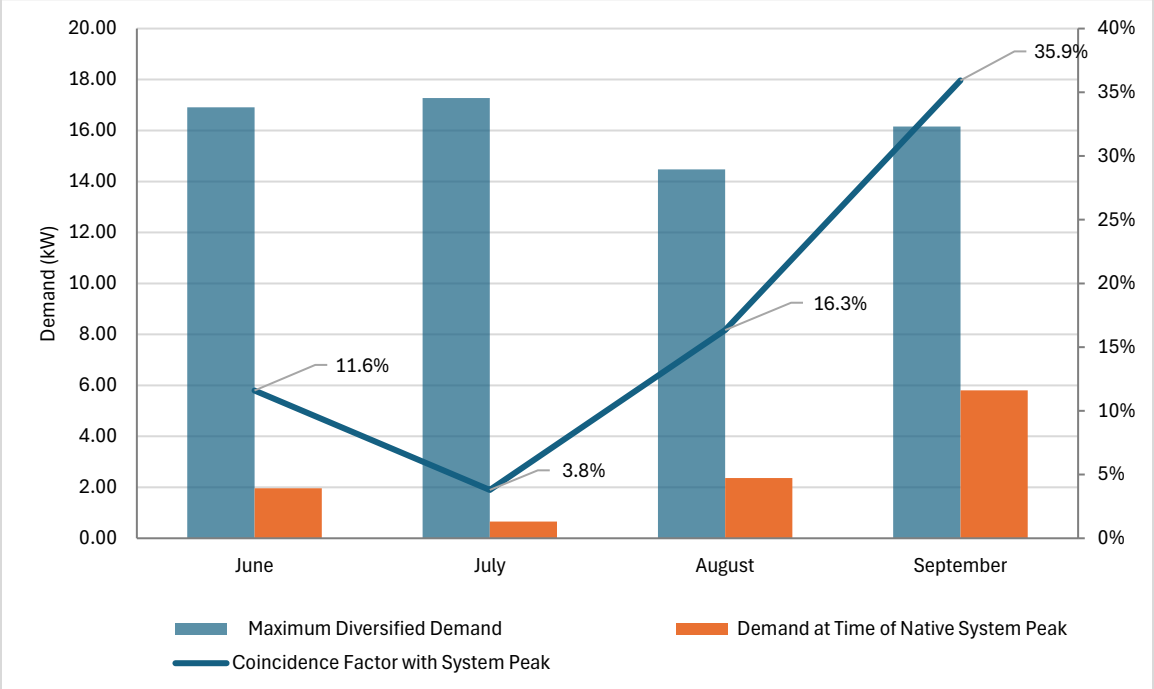

D. PEAK DEMAND

Q36. WHAT IS THE TREND OF THE TOTAL SYSTEM PEAK DEMAND?

A. EPE is a summer peaking utility. This means that EPE's system will experience a significantly higher load during the day between the months of June to September than it experiences at other times of the year. To efficiently meet peak demand, EPE's generation must be readily available during peak summer conditions and be

able to cycle or shut down completely during off-peak periods (e.g., nights, weekends and winter) and ramp up without limit as soon as needed. Over the past ten years (2015-2025), the system peak demand has had a compound annual growth rate ("CAGR") of 2.6%, while native energy has had a CAGR of 0.8%. This has resulted in a decreasing trend in EPE's system load factor.

Over the past decade, the EPE system load factor has decreased. Overall, the system load factor dropped from 53.2% in 2014 to 45.1% in 2025. The EPE system load factor has been declining over time in response to several factors: a rise in refrigerated air conditioning systems, an increase in energy efficiency, warming climate trends, an increase in the number of DG customers, and a decrease in industrial customers relative to residential customers.

Refrigerated air conditioning units use significantly more electricity than evaporative cooling units. The demand for electricity from refrigerated air conditioning units tends to be highest during hot summer days, when they cycle on and off in response to hot temperatures. In contrast, evaporative air conditioners have limited cycling. Increasing adoption of refrigerated air contributes to a downward trend in the system load factor, which means that demand grows faster than energy. Over time, this results in swings in demand that become more pronounced during the summer months, thus requiring additional generation to meet this demand. On the other hand, increases in energy efficiency have led to a

decrease in energy consumption. The effect of energy efficiency is more noticeable during the winter months as consumers continue to switch to LED lighting and ENERGY STAR appliances. In addition to the above, continued warming trends have resulted in above average temperatures in the summers months, driving growth in the native system peak.

Furthermore, the increased growth in customer-owned solar DG and decreased consumption by industrial customers relative to residential customers has also reduced the overall system load factor. DG customers on average have lower load factors than their non-solar counterparts, while industrial customers tend to be high load factor customers. This has resulted in a shift in the composition of EPE's customer mix to lower load factor customers.

Despite these factors exerting downward pressure on EPE's system load factor, EPE expects a reversal of this trend in the future. The emergence of EVs, along with proposed managed EV charging programs, can help alleviate this pressure by shifting usage to non-peak hours. In addition, expanded use of time-varying rate designs, such as time-of-day rates, will provide a financial incentive in customer bills to shift usage to off-peak or super off-peak hours. Finally, EPE has received inquiries from data centers interested in expanding into our service area. These data centers are high load factor customers that can contribute positively to our overall load factor.

IV. WEATHER NORMALIZATION

Q37. DID EPE UTILIZE A WEATHER ADJUSTMENT IN THE ANNUALIZATION PROCESS?

A. Yes. The weather normalization adjustment results in a level of sales that can be expected during the Base Period with average weather. The total weather normalization adjustment for New Mexico retail customers is an increase of 13,904,901 kilowatt hours ("kWh") (0.76%) from total New Mexico retail sales of 1,827,634,509 kWh at the end of the Base Period ending September 30, 2025. Similarly, a total weather normalization adjustment was made for Texas.

Q38. WHY IS IT REASONABLE AND NECESSARY TO UTILIZE A WEATHER NORMALIZATION ADJUSTMENT IN THE ANNUALIZATION PROCESS?

A. Weather normalization adjustments are necessary to avoid over- or understating the level of sales that could be expected during a year with average weather. Weather can have a profound impact on the month-to-month fluctuations in EPE's system energy sales. This is due in large part to the operation of heating and cooling equipment that is weather sensitive.

In EPE's service area, the adoption of central refrigerated air conditioning is increasing. Central refrigerated air conditioning equipment is replacing evaporative cooling equipment in residences and commercial establishments. Additionally, new residential construction projects usually include the use of refrigerated air units. As a result, EPE's load has become more weather sensitive because central refrigerated air conditioning uses much more energy and demand than evaporative cooling equipment.

Q39. IS THE COMPANY'S PROPOSED WEATHER NORMALIZATION ADJUSTMENT CONSISTENT WITH THE WEATHER NORMALIZATION ADJUSTMENT APPROVED BY THE COMMISSION IN EPE'S MOST RECENT RATE CASE?

A. Yes. The proposed weather normalization adjustment methodology is consistent with the methodology of the weather normalization adjustment approved by the Commission in EPE's most recent general rate case, Case No. 20-00104-UT.

Q40. DOES EPE USE WEATHER STATIONS FOR BOTH EL PASO AND LAS CRUCES?

A. Yes. An analysis of historical heating degree days ("HDD") and historical cooling degree days ("CDD") for El Paso and Las Cruces revealed that there are climate

differences between the two locations. I note this in Exhibit ES-4. These degree days measure the fluctuations in daily average temperature below or above the designated base temperature of 65 degrees Fahrenheit. Temperatures below the designated base temperature lead to increased use of heating appliances and are, therefore, referred to as HDDs. Conversely, fluctuations in daily average temperature above the designated base temperature lead to greater use of air conditioning and are referred to as CDDs.

Despite the fact that El Paso and Las Cruces are located in a dry desert climate and are less than 50 miles apart, they have some climate differences that make it important to match weather data at both locations to adjust their respective energy sales. Even though the temperatures in both cities tend to move in the same direction relative to each other, El Paso tends to be warmer than Las Cruces. Over the last 10 years, Las Cruces has consistently had fewer annual CDDs than El Paso.

Given these consistent differences in weather patterns between the two cities, EPE has concluded that it is appropriate to use two different weather sites for our analysis.

Q41. WHY HAS EPE MADE WEATHER NORMALIZATION ADJUSTMENTS TO THE ENERGY OF THE VARIOUS RATE CLASSES?

A. Adjustments for fluctuating temperature conditions are made to ensure that the kilowatt-hour sales levels, upon which rates are based, neither over-recover nor under-recover the Company's allowed cost of service. Base Period kilowatt-hour sales were adjusted to normalize Base Period sales for those rate classes whose use of electricity is sensitive to temperature conditions. During a given period, such as the Base Period, temperature conditions may be warmer or colder than normal. As a result, sales of electricity may be higher or lower than the level that will normally occur.

Q42. HOW WERE EPE'S WEATHER NORMALIZATION ADJUSTMENTS MADE?

A. EPE prepared statistical models that measure customer responsiveness to temperatures for all rate classes. Only those econometric models that displayed statistically significant effects to fluctuations in temperature were included in EPE's weather adjustment. EPE identified seven such econometric models in New Mexico.

The seven individual Rate Class models are:

- Rate 01 - Residential Service;
- Rate 03 - Small General Service;
- Rate 04 - General Service;

- Rate 05 - Irrigation Service;
- Rate 07 - City and County Service;
- Rate 08 - Water, Sewage, Storm Sewage Pumping or Sewage Disposal;
- Rate 10 - Military Research and Development Power Rate; and
- Rate 26 - State University Service.

Q43. WHICH RATE CLASSES WERE EXCLUDED FROM WEATHER NORMALIZATION ADJUSTMENTS?

A. Weather normalization adjustments were not made to Lighting classes or to Large Commercial and Industrial customer classes, since these customers' uses of electricity are not sensitive to fluctuations in temperature. Further, no weather normalization adjustment is proposed for RGEC since EPE does not have access to end-user information for this wholesale customer.

Q44. PLEASE SUMMARIZE THE PROCESS FOR CALCULATING WEATHER NORMALIZATION ADJUSTMENTS.

A. Weather normalization adjustments were calculated in a three-step process. First, linear regressions were employed to quantify the influence that factors such as CDDs, HDDs, and economic and/or demographic variables have upon monthly

electric consumption. A number of linear regression models were examined, and the models were tested for statistical strength and reasonableness.

Second, the coefficients of the regression equations were translated into monthly kWh adjustments for the Rate Classes. The regression coefficients for the explanatory variables in each regression equation equal the change in the dependent variable (kWh usage) associated with a one unit change in the explanatory variable. Thus, the regression coefficients for CDD provide the changes in monthly usage per customer associated with a one-unit change in CDDs. Similarly, the regression coefficients for HDD provide the changes in monthly usage per customer associated with a one-unit change in HDDs. Multiplying the degree day regression coefficient by the difference between the normal number of degree days and the Base Period actual degree days in a month produces the amount by which Base Period kWh varied from kWh use under normal temperature conditions. Exhibit ES-5 shows these calculations.

In the third step, for the residential class, the kWh per customer impact is multiplied by the number of monthly customers. The residential rate class is estimated on a use per customer basis because residential customers display homogenous consumption. The kWh weather impact estimate for this class is based on a per customer basis so multiplying by the number of customers in that month

is necessary to get a total weather effect value. Allocation of the monthly weather normalization adjustments is provided in Exhibit ES-5.

Q45. HOW DOES EPE CALCULATE NORMAL WEATHER?

A. EPE uses a 10-year average of monthly National Oceanic and Atmospheric Administration ("NOAA") HDDs and CDDs, adjusted for billing cycles, as a proxy for future average weather conditions. This weather data comes from official NOAA weather stations and is adjusted for missing values and other anomalies through AccuWeather.

NOAA is a federal agency that monitors climate and collects and publishes local weather pattern data. NOAA calculates HDD and CDD data that are used by forecasters to estimate the impact of weather on energy sales and load. Because CDDs and HDDs are recorded on a calendar month basis, while booked month sales are recorded over 18 billing cycles that normally include portions of two calendar months, it was necessary to transform these calendar month variables into variables that correspond to EPE's billing cycles. This transformation was accomplished through the use of two-month moving average CDD and HDD variables.

Q46. OTHER THAN CDDS AND HDDS, WHAT OTHER VARIABLES WERE EMPLOYED IN MODELING CONSUMER USE OF ELECTRICITY?

A. In addition to including CDD and HDD variables, each weather model was structured to incorporate economic and/or demographic variables that are likely to affect the use of electricity by the class being modeled.

Q47. WERE THE MODELS TESTED FOR STATISTICAL ACCURACY?

A. Yes. All models met statistical requirements for logical consistency in terms of the explanatory variables employed, signs of the coefficients, and consistency of results using alternative model specifications. In addition, the models were tested for significance of the independent variables as well as goodness of fit. The statistics of the models indicate that we have confidence in the degree day and economic variables employed in the models, and that these variables do an excellent job of explaining changes in energy use.

Q48. CAN YOU DESCRIBE HOW THE RESULTS OF THE REGRESSION EQUATIONS WERE TRANSLATED INTO WEATHER NORMALIZATION ADJUSTMENTS FOR EACH AFFECTED CLASS?

A. Yes. As described previously in my testimony, the coefficients of the CDD and HDD variables represent the change in energy use that corresponds to a one-degree day change in temperature. The weather effect is estimated as the product of the CDD and HDD coefficients and the difference between actual Base Year degree

days and normal degree days. For example, for the New Mexico Residential model, the July 2025 weather normalization adjustment was calculated as follows:

Normal CDD		539 CDD
Actual CDD	-	475 CDD
Difference CDD		64 CDD
August CDD Coefficient	X	0.9719 kWh/CDD/Customer
Difference X Coefficient		62 kWh/Customer
Number of Customers	X	97,069 Customers
Adjustment		6,063,866 kWh

Note: Due to rounding, the totals in the example above do not add to the total adjustment.

All other months were calculated in the same manner using data specific to each month. The example above employs a monthly use per customer as the dependent variable. The models that employ total rate class kWh as the dependent variable do not have to multiply the resulting change in kWh by the number of customers in the class. Once the monthly kWh use for the weather sensitive classes was developed, the weather-adjusted monthly kWh use was further adjusted for year-end customer growth as explained in the direct testimony of EPE witness Mr. Gonzalez. Please refer to Exhibit ES-5 for the monthly calculations by rate class described previously.

Q49. WHAT WAS THE EFFECT OF THE WEATHER NORMALIZATION ADJUSTMENT ON KWH SALES FOR NEW MEXICO RETAIL CUSTOMERS?

A. The weather normalization adjustment reflects a reduction in kWh sales to account for the slightly warmer weather during the Base Period. The reduction is necessary to re-state sales at more normal levels that can be reasonably anticipated when new rates are placed into effect. The total weather adjustment for New Mexico retail customers is an increase of 13,904,901 kWh (0.76%) from total New Mexico retail Base Period sales of 1,827,634,509 kWh.

This adjustment is provided for each affected rate class by month on Exhibit ES-5. In addition, Exhibit ES-5 also provides the calculation of the monthly weather normalization adjustments for each rate class.

V. UPDATED SYSTEM LOSS ANALYSIS

Q50. PLEASE DESCRIBE THE SYSTEM LOSS ANALYSIS EPE PROPOSES BE ADOPTED IN THIS PROCEEDING.

A. EPE commissioned Management Applications Consulting, Inc. ("MAC") in May 2022 to provide an updated system-wide loss study based on calendar year 2021 data (the "2021 loss study" or "2021 system loss study"). MAC performed the 2017 loss study, which was accepted by the Commission and is currently utilized by EPE for allocation,

rate design and fuel adjustment purposes in New Mexico. The 2021 loss study uses the same methodology used by MAC in the 2017 loss study.

The system loss study develops separate demand (kW) and energy (kWh) loss factors for each voltage level of service in EPE's power system. The cumulative loss factor results by voltage level are used to adjust metered kW and kWh sales data for losses in performing cost of service analysis, rate design, developing the proposed Fuel and Purchased Power Cost Adjustment Clause factor, and for other analyses which require loss adjustments.

The loss analysis model incorporates extensive use of the Company's peak hour power flow data. In addition, load data at the substation and customer level, coupled with primary and secondary network information were used to model the distribution system to calculate losses. Measured and estimated load data provides a means of calculating reasonable estimates of losses by using a "top down" and "bottom-up" procedure. In the "top-down" approach, losses from the high voltage transmission system, through and including distribution substations, were calculated along with power flow data, conductor and transformer loss estimates, and energy delivered to the loads.

EPE's load research data provided the starting point for performing the "bottom-up" approach for estimating the remaining distribution losses. Basically, this approach develops line loadings by first determining loads and losses at each level

beginning at a customer's meter and service entrance and then going through secondary lines, line transformers, primary lines and finally distribution substations. These distribution system loads and associated losses are then compared to the initial calculated input into Distribution Substation loadings for reasonableness prior to finalizing the factors.

Q51. IS THE UPDATED SYSTEM LOSS STUDY PROVIDED WITH EPE'S APPLICATION IN THIS PROCEEDING?

A. Yes, the 2021 system loss study is included as Schedule M-3.

Q52. HAVE THE UPDATED LOSS FACTORS AND THE RESULTS OF THE LOSS STUDY BEEN INCORPORATED INTO EPE'S PROPOSED RATES?

A. Yes. In addition to the inclusion of the demand and energy loss factors in the calculation of demand and energy allocation factors, the calculated average loss factors for line transformers were used in the calculation of the proposed Meter Voltage Adjustment included in the Municipal Pumping, General Service, Large Power Service, University Service, and Interruptible Service rates.

Q53. HOW DO THE PROPOSED DEMAND AND ENERGY LOSS FACTORS COMPARE TO THOSE CURRENTLY EMPLOYED BY EPE?

A. The summary table provided in Schedule M-3 compares the proposed demand and energy loss factors at various voltages.

VI. ENERGY AND DEMAND FORECAST

Q54. PLEASE DESCRIBE THE APPROACH THAT EPE USED TO DEVELOP ITS SALES FORECASTS PRESENTED IN SCHEDULE P-1 IN THE RATE APPLICATION.

A. EPE employs an econometric approach. This approach involves the application of mathematics and statistical methods to the analysis of economic data and the relationship between economic variables to provide an empirical estimation of those relationships. EPE's econometric forecasting models relate customer electric usage to service area trends in population, local economic indicators, and weather to estimate future electricity sales. For example, population, personal income, and weather are typical drivers of electricity sales: more customers and increased income to purchase appliances will typically result in higher electricity demand. The primary reference for these assumptions is the regional macroeconomic forecasts prepared by S&P Global.

Q55. IS AN ECONOMETRIC FORECASTING METHODOLOGY GENERALLY USED BY COMPANIES IN THE ELECTRIC INDUSTRY?

A. Yes.

Q56. PLEASE DESCRIBE THE METHODOLOGY EPE USED TO DEVELOP THE SALES AND DEMAND FORECASTS PRESENTED IN THIS TESTIMONY.

A. EPE develops jurisdictional customer class sales forecasts based on monthly macroeconomic data and historic and forecasted customer data for each respective jurisdiction. EPE develops individual rate class econometric forecasts if rate classes are experiencing changes not in line with their historical trend. EPE's forecasts for energy sales are functions of variables such as population, income, employment, and other economic and demographic variables. The econometric sales forecasts and resulting peak demand forecast were adjusted to reflect energy efficiency, distributed generation, and an increase in sales from electric vehicle adoption and expected new load from new and current customers.

Q57. ARE ALL OF EPE'S SALES ESTIMATES BASED ON AN ECONOMETRIC MODEL?

A. No. In the few cases where adequate data was not available to support statistical analysis, EPE relied on non-econometric sales and load information. Examples of situations that require non-econometric estimates include significant

expansion/reduction by an existing customer as well as expansion of DG customers and transportation electrification.

Given that DG is relatively new for modeling purposes, there is limited historical regional data, so it is not suitable for econometric forecasting models. Future estimates for DG customers and load are based on recent trends, sample studies, and known or reasonably predictable changes in consumption levels.

Finally, similar to DG, EPE also forecasts the expected adoption of EVs. The energy and demand forecast include out-of-model adjustments for light-duty, medium-duty, heavy-duty EVs and electric buses.

Q58. HOW DOES EPE DETERMINE THE MONTHLY SYSTEM ENERGY REQUIREMENT (SALES AT THE SOURCE)?

A. EPE combines the annual retail sales, sales to RGEC, and Company use, and then calculates line losses using a loss rate derived from the 2021 system loss study. These system losses must be included with sales at the meter to accurately develop the total energy requirement needed to deliver electricity to EPE's customers. Finally, out-of-model adjustments are made to account for energy efficiency, DG customers, EVs, and data center consumption anticipated for the forecasting period.

Q59. HOW ARE EPE'S PEAK DEMAND FORECASTS DEVELOPED?

A. EPE uses the native system load factor relationship to estimate future annual peak demands. Load factor defines the relationship between energy and peak demand.

System Load Factor = System Energy / (Peak Demand x Hours in a Year)

For example, the annual load factor for 2024 was:

System Load Factor = 9,261,368 MWh / (2,316 MW x 8,784 hours) = 0.455

EPE applied a one-year load factor of 0.455. This load factor was used to develop the peak demand forecast for 2025. The load factor was then decreased at an equal rate for 5 years until reaching the load factor of 0.438 witnessed in 2023, which is the lowest load factor observed by EPE. The load factor was kept constant for the remainder of the forecasting period. Similar to the native energy forecast, these values are then adjusted for expected decreases/increases to load resulting from energy efficiency, DG, and EVs. The final adjustment made to forecasted peak demand is to subtract interruptible load.

Q60. WHAT ARE THE ECONOMIC AND DEMOGRAPHIC VARIABLES USED IN DEVELOPING EPE'S FORECASTS?

A. The economic and demographic variables used in the forecasts are the projections for gross metropolitan product, wages, employment, personal income, population, and weather.

Q61. DOES EPE RELY ON AN INDEPENDENT SOURCE IN ACCOUNTING FOR THE MODEL'S USE OF ECONOMIC AND DEMOGRAPHIC FORECASTS?

A. Yes. The population, income, and employment data series for EPE's service area are taken from S&P's regional economic forecasts for El Paso and Las Cruces that I described earlier in my testimony. S&P's forecasts provide EPE with data that is independent and free from any internal bias. S&P provides EPE with a large data set of regional variables that are routinely updated. Moreover, S&P is an internationally recognized macroeconomic forecasting service with a customer base that includes clients in industry, banking, government, and academic institutions.

VII. SUMMARY AND CONCLUSIONS

Q62. PLEASE SUMMARIZE YOUR TESTIMONY AND CONCLUSIONS.

A. My testimony discusses EPE's load research function and its role in gathering the energy and demand data necessary for assigning costs to jurisdictions and rate classes, as well as for the development of tariffs. The load research methodologies used by EPE are fair and reasonable for the assignment of costs and the development of tariffs and are consistent with prior filings.

I describe and support the proposed weather normalization adjustment. In my opinion, the proposed weather normalization adjustment is both fair and reasonable. The economic models used to develop the adjustments employ standard industry practices, and the models have a high level of statistical confidence. The proposed weather normalization adjustment follows a consistent methodology with the weather adjustment submitted in EPE's previous rate case. Furthermore, the weather normalization adjustment fairly and reasonably reflects normal weather during the Base Period. The total weather normalization adjustment for New Mexico retail customers is an increase of 13,904,901 kWh (0.76%) from total New Mexico retail Base Period sales of 1,827,634,509 kWh.

I describe and support EPE's 2021 system-wide loss study, which is based on the methodology used in EPE's most recently approved 2017 system-wide loss study, results in reasonable system loss factors, and should be approved by the Commission.

Finally, I describe EPE's forecasted sales and demand in support of Schedule P-1. In my opinion, the forecasted sales and demand values are both fair and reasonable. These growth rates are consistent with recent customer growth trends and the economic growth projections for our service territory.

Q63. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

A. Yes, it does.

EL PASO ELECTRIC COMPANY
DIRECT TESTIMONY OF
ADRIAN HERNANDEZ

I. INTRODUCTION AND QUALIFICATIONS

Q1. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Adrian Hernandez. My business address is 100 N. Stanton Street, El Paso, Texas 79901.

Q2. HOW ARE YOU EMPLOYED?

A. I am employed by El Paso Electric Company ("EPE" or the "Company") as Supervisor - Revenue Requirements and Cost Analysis.

Q3. PLEASE SUMMARIZE YOUR EDUCATIONAL AND PROFESSIONAL QUALIFICATIONS.

A. I earned a Bachelor of Business Administration in Accounting with a minor in Finance from the University of Texas at Austin in 2007. I subsequently earned a Master of Accountancy from the University of Texas at El Paso in 2011. My specialized utility training includes a graduate certificate in Public Utility Regulation & Economics from New Mexico State University ("NMSU") in 2014, followed by a Master of Business Administration from NMSU in 2017. I am also a licensed Certified Public Accountant in the State of Texas, which requires the completion of continuing professional education.

My professional career began in 2007 as a Business Analyst in the public services division of BearingPoint Inc. in the Washington, D.C. area. In 2008, I

served as a Cost Accountant for Helen of Troy Limited before joining EPE in August 2009 as a Regulatory Accountant. In that role, I was responsible for preparing and reviewing jurisdictional regulatory accounting, fuel and operational reports, and supporting workpapers. My work focused extensively on fuel-related matters, including the monitoring of over- and under-collections and the preparation of fuel-related regulatory filings.

In 2014, I transitioned to EPE's Rates and Regulatory Affairs Department, where I performed and assisted in economic, statistical, and cost studies. I was promoted to Senior Rate Analyst in 2016, where my responsibilities expanded to include the development of models for cost of service ("COS"), profitability, and pricing studies, as well as revenue forecasting and rate design. I have participated in numerous regulatory proceedings, including base rate cases, fuel rate revisions, energy efficiency filings, and advanced metering infrastructure ("AMI") cases.

In June 2022 I was promoted to Principal Rate Analyst where, in addition to those already mentioned in the paragraph above, my responsibilities as Principal Rate Analyst included implementing a new regulatory solution from Utilities International Solutions Group ("UISG" or "UI"). This regulatory solution is what I used to prepare EPE's cost-of-service model. In December 2024, I was promoted to my current position as Supervisor of the Revenue Requirements and Cost Analysis department.

Q4. PLEASE DESCRIBE YOUR CURRENT RESPONSIBILITIES WITH EPE.

A. As Supervisor of Revenue Requirements and Cost Analysis, I lead a team responsible for the development of accurate and comprehensive cost-of-service studies and revenue requirement analyses for both regulatory filings and internal strategic planning. My duties include overseeing the generation of COS schedules, workpapers, and exhibits using the UI Regulatory solution, ensuring that all filings maintain technical integrity and comply with applicable regulatory standards and Commission procedures.

Q5. HAVE YOU PREVIOUSLY PRESENTED TESTIMONY BEFORE UTILITY REGULATORY BODIES?

A. Yes, I have testified on behalf of EPE in cases before the New Mexico Public Regulation Commission ("Commission" or NMPRC") and the Public Utility Commission of Texas.

II. PURPOSE OF TESTIMONY

Q6. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. The purpose of my testimony is to present EPE's COS studies. EPE's COS studies consist of the functional cost-of-service ("FOCOS") study; demand, energy, and customer ("DEC") component costs ("DEC Study"); jurisdictional cost-of-service ("JCOS") study; and class cost-of-service ("CCOS") study. These

studies, which are summarized in many of the schedules listed in Figure AH-1, establish the cost basis for EPE's proposed rates as detailed in the direct testimony of EPE witness Manuel Carrasco.

Furthermore, my testimony presents an alternative CCOS study as required by the Commission's Final Order in Case No. 20-00104-UT. This alternative study models the reopening of Rate No. 7 to new customers and qualifying existing customers currently served under Rate No. 3, Rate No. 4, and Rate No. 9.

Q7. WHAT SCHEDULES DO YOU SPONSOR OR CO-SPONSOR?

A. The schedules that I sponsor or co-sponsor are listed in Figure AH-1 below:

Figure AH-1

SCHEDULE	DESCRIPTION
A-1	Summary of Overall Cost of Service and the Claimed Revenue Deficiency
A-3	Summary of the Cost of Service Adjustments by Functional Classification
A-4	Summary of Rate Base – Jurisdictional
K-1	Allocation of Rate Base – Jurisdictional
K-2	Allocation of Rate Base – Functional Classification
K-3	Allocation of Rate Base – Demand, Energy, and Customer
K-4	Allocation of Rate Base to Rate Classes
K-5	Allocation of Total Expenses – Jurisdictional
K-6	Allocation of Total Expenses – Functional Classification
K-7	Allocation of Total Expenses – Demand, Energy, and Customer
K-8	Allocation of Total Expenses to Rate Classes
L-1	Allocated Cost of Service per Billing Unit by Rate Classification
M-1	Allocation Factors Used to Assign Plant and Expenses to Rate Classes
M-2	Classification Factors Used to Assign Plant and Expenses to Demand, Energy, and Customer
N-1	Rate of Return by Rate Classification
P-2	Plant in Service – Jurisdiction
P-3	Property Retirements and Property Investments Information – Jurisdiction
P-4	Operation and Maintenance Expense Information – Jurisdiction
P-12	Fuel Statistics Information – Jurisdictional

Q8. ARE YOU SPONSORING ANY EXHIBITS IN YOUR TESTIMONY?

A. Yes. I am sponsoring the exhibits listed in the Table of Contents page, which are attached to this testimony.

Q9. WERE THE SCHEDULES AND EXHIBITS YOU ARE SPONSORING OR CO-SPONSORING PREPARED BY YOU OR UNDER YOUR DIRECT SUPERVISION?

A. Yes, they were.

III. COST-OF-SERVICE STUDY OVERVIEW

Q10. IS A COST-OF-SERVICE STUDY REQUIRED AS PART OF A GENERAL RATE CASE FILING?

A. Yes. Rule 530 requires that a fully allocated cost-of-service study be included in the Schedule K Series of a general rate case application. The purpose of a cost-of-service study is to appropriately assign costs to jurisdictions and classes of customers using the cost causation principle to ensure fair pricing of electric service. The results of the COS studies are used by EPE witness Carrasco for developing proposed rates.

Q11. WHAT DATA ARE USED IN EPE'S COST-OF-SERVICE STUDIES?

A. The cost-of-service studies use revenue and cost data based on EPE's Base Period and Historical Test Year Period ended September 30, 2025. The Base Period data were compiled from EPE's accounting records, which are maintained in accordance with the Commission's prescribed accounting system, the Federal Energy Regulatory Commission ("FERC") Uniform System of Accounts. This data is compiled on a total Company basis and then allocated to the New Mexico retail jurisdiction based on direct assignments or using the appropriate allocation factors.

As discussed in the testimony of EPE witness Steven A. Sierra, the total Company Base Period book balances were adjusted to reflect annualization, known and measurable changes, and pro forma adjustments for plant-in-service additions to arrive at Historical Test Year Period amounts. As described in the direct testimony of EPE witness Sierra, the Test Year adjustments are generally based upon rate treatments approved in Case No. 20-00104-UT ("2020 Rate Case").

Q12. DO EPE'S ACCOUNTING RECORDS REFLECT FERC ORDER 898?

A. Yes, beginning January 1, 2025, EPE books reflect the new accounts added by FERC Order 898, as described in EPE witness Cynthia S. Prieto's direct testimony.

Q13. WHAT ARE THE TYPICAL STEPS INVOLVED IN DEVELOPING A COST-OF-SERVICE STUDY?

A. The cost-of-service study typically consists of three steps: functionalization, classification, and assignment. Each of these steps is described below.

Q14. PLEASE DESCRIBE COST FUNCTIONALIZATION.

A. Once the Base Period costs are finalized and recorded in EPE's accounting ledgers, the accounting data can be utilized to determine the functions associated with those costs. These functions are:

- Production – costs associated with the production of energy and capacity, including purchased power;
- Transmission – costs associated with the high voltage system that transports the power to load centers;
- Distribution – costs associated with distributing the energy from the transmission system to the end users;
- Customer Service – costs associated with providing service to the customer, e.g., meter reading, billing, etc.; and
- Administrative and General – common costs, such as management, buildings, software, support services, etc., which are incurred to support the core functions of electric service listed above.

EPE's cost of service now includes a Functional COS step. I will discuss this new step in more detail later.

Q15. PLEASE DESCRIBE COST CLASSIFICATION.

A. The next step is to classify the functionalized costs according to the characteristics of the utility service being provided. The three principal cost classifications are demand-related costs, energy-related costs, and customer-related costs.

- Demand-related costs are those fixed costs that are related to the kilowatt ("kW") demand that the customers place on the system at any point in time. These costs vary with the maximum demand imposed on the various components (facilities) of the power system by the customers.
- Energy-related costs are those costs that are related to the kilowatt-hours ("kWh") of energy that the customer utilizes over time. These costs, primarily fuel, vary with the overall quantity of energy consumed.
- Customer-related costs are those costs incurred as a result of the number of customers on the system but irrespective of the customer's load. These costs, such as meters and billing, are incurred to serve individual customers.

EPE's COS model incorporates the classification of costs at a more detailed level in its DEC study.

Q16. ONCE THE COST OF SERVICE IS FUNCTIONALIZED AND CLASSIFIED, HOW ARE COSTS ASSIGNED?

A. After functionalization and classification, responsibility for each cost is then determined through allocation or direct assignment. The process of allocating costs starts with using operating and accounting data to develop allocation factors by rate class that correspond to each cost classification factor (Demand, Energy, and Customer). These allocation factors are then calculated as percentages (i.e., New Mexico jurisdiction or residential class as a percent of total). The allocation factors are then applied to specific costs and rate-base items to derive EPE's cost of service for each jurisdiction or rate class. If costs were incurred to benefit a clearly identifiable jurisdiction or rate class, a direct assignment of that cost is made.

Q17. HAS EPE MADE ANY CHANGES TO THE COST-OF-SERVICE MODEL SINCE ITS LAST NEW MEXICO RATE CASE, CASE NO. 20-00104-UT?

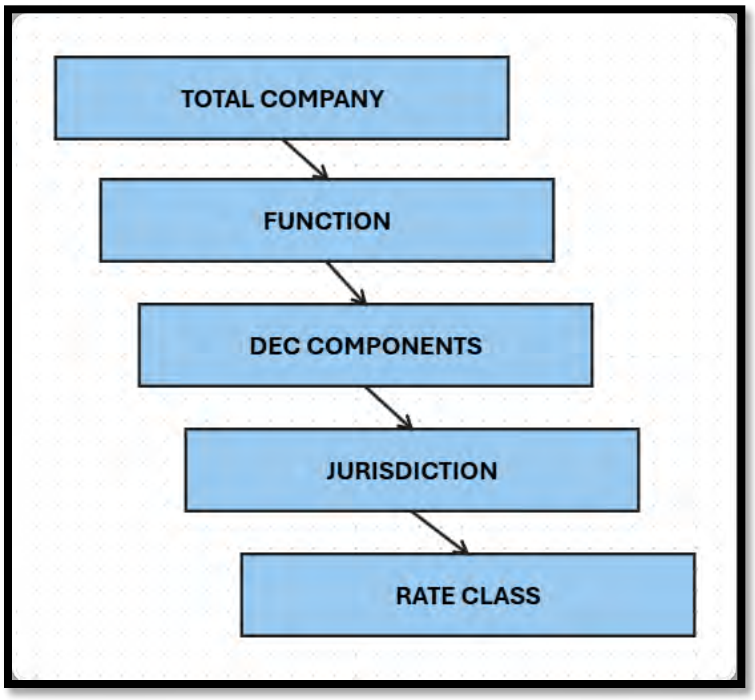
A. Yes. EPE has implemented a new regulatory software solution from UISG to prepare its COS studies.

Q18. ARE THERE ANY SIGNIFICANT DIFFERENCES BETWEEN THE UISG COST-OF-SERVICE MODEL COMPARED TO THE PRIOR COS MODEL?

A. Yes. The first major difference is that the UISG regulatory module integrates with EPE's other UISG modules that have also been implemented, including the Spending, Plant/Tax, and Financial Planning modules.

Another significant difference is that EPE's new COS model now includes a function step early in the process, which will make the assignment to functions more transparent. The COS model will be presented in the following order shown in Figure AH-2 below:

Figure AH-2



Some other significant differences with EPE's new UI regulatory software include:

- Improved accounting code block presentation;
- Automation of essential schedules and workpapers; and
- Quicker turn-around time in model runs.

Q19. ABOVE YOU MENTIONED THAT THE NEW UISG MODEL HAS IMPROVED THE ACCOUNTING CODE BLOCK PRESENTATION, WHAT DOES "ACCOUNTING CODE BLOCK" MEAN AND HOW HAS IT IMPROVED WITH THE UISG REGULATORY MODEL?

A. "Accounting code block" refers to the structured set of codes used to categorize financial transactions and data within an organization's accounting system. In the context of EPE's cost of service model, the accounting code block typically includes components such as the FERC Account, Operating Segment, Expenditure Type, and Project for operation and maintenance ("O&M") expenses or Functional Class, Depreciation Summary, and Depreciation Group for Plant-related costs. The improved presentation in the UISG regulatory model allows for clearer visibility and more precise assignment of costs, enhancing transparency and efficiency in the cost allocation process.

Q20. HAS THE OVERALL METHODOLOGY OF THE COST-OF-SERVICE MODEL CHANGED WITH THE USE OF THE UISG REGULATORY MODEL?

A. No. Even with some of the updates we have made with the new UISG model, the overall methodology has not changed. EPE continues to use the National Association of Regulatory Utility Commissioners' ("NARUC") "Electric Utility Cost Allocation Manual" ("NARUC Manual") as a general guide for its cost of service.

While EPE's overall approach will not change, some cost allocation modifications will be proposed in this filing. I discuss these modifications in more detail later in my testimony.

IV. FUNCTIONAL COST-OF-SERVICE STUDY

Q21. WHY HAS EPE PRODUCED A FUNCTIONAL COST-OF-SERVICE STUDY?

A. EPE has always functionalized its costs as part of the process of preparing its COS studies, but EPE's previous COS models have not been as clear with regard to functionalization. Therefore, in the interest of being more transparent and to improve allocations, EPE's COS studies will now include a Functional Cost-of-Service (FCOS) study as a first step.

Q22. HOW DOES EPE DETERMINE THE FUNCTION THAT APPLIES TO THE COSTS?

A. EPE first relies on the functionalized FERC Accounts to determine whether the cost is associated with Production, Transmission, Distribution, or Customer. For example, the O&M expense accounts are presented in the uniform system of accounts in their respective sections by function. Also, EPE's plant-in-service is reported by functional class and utility plant accounts that make it easy to determine the high-level function with which it is associated.

Q23. WHAT TYPES OF ALLOCATORS ARE USED IN THE FUNCTIONAL COST-OF-SERVICE STUDY?

A. The UISG model utilizes two primary types of allocators: Input (external) and Dynamic (internal).

- **Input Allocators** are sourced externally and either imported or manually entered into the model. In this FCOS, input allocators are generally straightforward, as most costs are directly assigned to specific functions—Production, Transmission, Distribution, or Customer—based on account data and accounting code block details.
- **Dynamic Allocators** are used when a cost cannot be directly associated with a single function. These costs are allocated indirectly using a calculated basis, such as labor or net plant-in-service costs.

Q24. HOW DOES EPE DEVELOP THE LABOR ALLOCATION FACTOR?

A. The LABOR allocator is developed by first directly assigning O&M labor costs (excluding A&G) to their respective functions. These functionalized totals are then summed to create the dynamic LABOR allocator used to distribute indirect costs. A high-level illustration of how the LABOR allocator is developed in the FCOS is shown below in Table AH-1:

Table AH-1

Description	Production	Transmission	Distribution	Customer	Other	Total
Production O&M	$20m	$0	$0	$0	$0	$20m
Transmission O&M	$0	$12m	$0	$0	$0	$12m
Distribution O&M	$0	$0	$17m	$0	$0	$17m
Customer O&M	$0	$0	$0	$9m	$0	$9m
Total Labor ($)	$20m	$12m	$17m	$9m	$0	$58m
LABOR (%)	34.5%	20.7%	29.3%	15.5%	0.0%	100%

The LABOR allocator is used to allocate costs such as general plant in the FCOS.

The labor allocators are developed using a consistent methodology across the DEC, JCOS, and CCOS studies.

Q25. HOW ARE ALLOCATORS ASSIGNED TO COSTS IN THE FCOS?

A. Allocator assignment is largely driven by functionalized accounts for Plant and O&M costs. For more granular detail, EPE leverages accounting code block

fields (Operating Segment, Project, Expenditure Type) and specific ledger data, including depreciation groups and tax-related Schedule M items.

Q26. HOW DOES EPE DETERMINE THE ALLOCATOR ASSIGNED TO A COST FOR WHICH THE FUNCTION IS NOT KNOWN?

A. There are many instances where certain costs have no direct association with a function but are still assigned to a function indirectly. For example, General Plant and most Administrative and General expenses are typically assigned a Labor allocator as discussed above. Other dynamic allocators spread costs to functions based on net plant or rate base in the FCOS. However, for certain revenues and revenue-related costs, instead of allocating across functions EPE assigns them to Other.

Q27. WHY DOES EPE HAVE A FUNCTION CALLED "OTHER"?

A. The Other function is used for certain items where the function is not known and where it does not make sense to allocate it across functions. These items include certain revenues or revenue-related expenses where they will be placed in the Other function as a placeholder to be assigned to Jurisdiction and Rate Class later in the JCOS and CCOS studies, respectively.

Q28. IS THERE A SCHEDULE THAT PRESENTS RATE BASE AND EXPENSES BY FUNCTION?

A. Schedules K-2 and K-6 present EPE's rate base and expenses by function, respectively. For further detail, refer to Workpaper K.

V. DEMAND, ENERGY, AND CUSTOMER COMPONENTS STUDY

Q29. PLEASE DESCRIBE THE DEMAND, ENERGY, AND CUSTOMER COMPONENTS STUDY.

A. The Demand, Energy, and Customer Components Study ("DEC Study") is the second step in the process after the FCOS study. The DEC Study allocates costs to each of the DEC components. These DEC results along with the CCOS results (discussed later in my testimony) are essential in developing rates and are provided to EPE witness Carrasco for that purpose.

Q30. HOW DO THE FUNCTIONALIZED COSTS IDENTIFIED IN PREVIOUS STEPS RELATE TO THE COSTS PRESENTED IN THE DEC STUDY?

A. The functionalized costs of Production, Transmission, Distribution, and Customer are classified into Demand, Energy, and Customer components in the DEC Study as shown in Table AH-2.

/

/

Table AH-2

Cost Functions	Cost Classifications
Production	Demand Related Energy Related
Transmission	Demand Related
Distribution	Demand Related Customer Related
Customer	Customer Related
Other	Other

Q31. WHAT ARE THE SPECIFIC COMPONENTS PRESENTED IN THE DEC STUDY THAT MAKE UP THE DEMAND, ENERGY, AND CUSTOMER CLASSIFICATIONS?

A. The components are shown in Table AH-3 below.

/

/

/

/

/

/

/

/

/

Table AH-3

Demand	Energy	Customer	Other
Demand- Production	Energy- Other	Customer- Other	Other
-Dem Prod- 4CP-A&E	Energy- Fuel	Customer- Deposits	
-Dem Prod- 4CP		Customer- 369 Services	
-Dem Prod- 12CP-A&E		Customer- 370 Meters	
Demand- Transmission		Customer- 371 Cust Installs	
Demand- Distribution		Customer- 373 Strt Lightng	
-Load Dispatching		Customer- 902 Meter Read	
-Poles Towers Fixtures- Primary		Customer- 903 Cust Rec Co	
-Poles Towers Fixtures- Secondary			
-Overhead Lines- Primary			
-Overhead Lines- Secondary			
-Underground Lines- Primary			
-Underground Lines- Secondary			
-Line Transformers- Primary			
-Line Transformers- Secondary			

Q32. HOW IS PRODUCTION PLANT-IN-SERVICE CLASSIFIED?

A. Production plant is classified as demand related. Therefore, all production plant accounts fall under the Demand - Production components. Peaking generation plant-in-service costs fall under the 4CP demand production component. All other generation plant-in-service costs will be classified under the 4CP-A&E demand production component.

Q33. HOW IS TRANSMISSION PLANT-IN-SERVICE CLASSIFIED?

A. Transmission plant is classified as demand related, and all transmission plant accounts fall under the Demand - Transmission component.

Q34. HOW IS DISTRIBUTION PLANT-IN-SERVICE CLASSIFIED?

A. Distribution investments serve customer demand as well as providing a basic investment uniformly common to all customers. For this reason, Distribution plant will have both a Demand component and a Customer component as seen in Table AH-3 above.

Distribution Plant Account No. 360 - Land and Land Rights, Account No. 361 - Structures and Improvements, and Account No. 362 - Station Equipment are assigned to the Distribution - Load Dispatching component of Demand. Distribution Plant Account No. 364 - Poles is assigned to the Distribution - Poles, Towers, and Fixtures component of Demand. Account No. 365 - Overhead Conductors is assigned to the Distribution - Overhead component of Demand. Account No. 366 - Underground Conductors and Account No. 367 - Underground Conduits are assigned to the Distribution - Underground component of Demand. All of these are separated based on the distribution voltage level served, either primary or secondary. Account No. 368 - Line Transformers is also separated based on whether the distribution voltage level served is primary or secondary and is assigned to the Distribution - Transformer component of Demand.

Account No. 369 - Services is classified as a customer-related cost and is assigned to the Customer - 369 Services component under Customer. Account No. 370 - Meters is classified as a customer-related cost and assigned to the

Customer No. 370 - Meters component under Customer. Account No. 371 – Installations on Customers' Premises is classified as a customer-related cost and assigned to the Customer No. 371 – Installs on Customer Premises component under Customer. Finally, Account No. 373 – Street Lighting and Signal Systems is classified as a customer-related cost and assigned to the Customer No. 373 – Street Lighting component under Customer.

Q35. HOW IS ENERGY STORAGE PLANT-IN-SERVICE CLASSIFIED?

A. During the Base Period, EPE operated one energy storage facility: a battery located at a customer-sited solar installation. Due to its relatively small scale and its function of directly serving that specific customer, EPE classifies this asset as Distribution Plant – Load Dispatching.

Q36. HOW ARE GENERAL PLANT-IN-SERVICE COSTS ALLOCATED TO DEC COMPONENTS?

A. General Plant-in-Service costs follow labor allocation factors. By leveraging the functionalized payroll data from the FCOS, the DEC study assigns these costs according to their specific Functional payroll allocators as follows:

- PRODLABOR – allocates to Demand Production and Energy Other components

- TRANLABOR – allocates to Demand Transmission component
- DISTLABOR – allocates to Demand Distribution and Customer components associated with distribution plant.
- CUSTLABOR – allocates to Customer components associated with customer accounts (O&M).

Q37. HOW IS WORKING CAPITAL ALLOCATED IN THE DEC STUDY?

A. Fuel inventory is allocated with the E2ENERGY allocator. Prepayments and Materials and Supplies are tagged with different allocators depending on the functional account code block descriptions. Consistent with the previous steps in the COS, the calculation of Working Cash in UISG uses the allocated DEC results.

Q38. IS THERE A SCHEDULE THAT SHOWS HOW ALL RATE BASE AMOUNTS ARE ASSIGNED TO DEMAND, ENERGY, AND CUSTOMER?

A. Yes. Schedule K-3 itemizes all the rate base costs and presents them by Demand, Energy, and Customer component classifications. For further detail, refer to Workpaper K.

Q39. HOW ARE POWER PRODUCTION EXPENSES CLASSIFIED?

A. Fuel and purchased power expenses do not have a base-rate impact since they are recovered (off-set) by fuel-related revenues. All fuel-related expenses and revenues are assigned to the Energy - Fuel component. The remaining non-fuel, energy-related costs are assigned to the Energy - Other component. Demand-related production O&M costs associated with load-dispatching costs (Account 556) are assigned to the Demand – Production 12CP-A&E component. Demand-related production O&M costs associated with peaking generation costs are assigned to the Demand – Production 4CP component. All other demand-related production O&M costs are assigned to the Demand – Production 4CP-A&E component.

Q40. HOW ARE TRANSMISSION O&M EXPENSES CLASSIFIED?

A. Similar to Transmission plant, all Transmission O&M expenses fall under the Transmission component of Demand.

Q41. HOW ARE DISTRIBUTION O&M EXPENSES ALLOCATED TO DEC COMPONENTS?

A. Similar to the CCOS study, Distribution O&M expenses are allocated based on the related distribution plant account allocation. An exception is when using a blended allocator for supervision and engineering accounts and the miscellaneous

distribution expense. Also, rents are allocated based on total Distribution plant as in the CCOS study. Similar to Distribution plant, Distribution O&M expenses will have both Demand and Customer components.

Q42. HOW ARE CUSTOMER SERVICE EXPENSES CLASSIFIED?

A. All customer service expenses will be classified as Customer-related. Account No. 902 - Meter Reading Expense is assigned to the Customer - 902 Meter Reading component. Account No. 903 - Customer Record & Collections is assigned to the Customer – 903 - Customer Rec & Collections component. Account No. 904 - Uncollectible Accounts, Account No. 905 - Misc. Customer Accounts Expenses, and Account No. 909 - Informational and Instructional Advertising Expenses are all classified under the Customer - Other component. Account No. 908 - Customer Assistance Expense is related to training and education on EPE advanced meters so it is classified to the Customer – 370 Meters component.

Q43. HOW ARE A&G EXPENSES ASSIGNED TO DEC COMPONENTS?

A. If the A&G account code block descriptions provide enough detail to determine a function or a DEC Component classification, then those costs are assigned to those DEC Components that are associated with the code block description. The remaining A&G expenses for which a specific classification cannot be determined

are allocated using mostly the LABOR allocation factors specific to the function it was allocated to in the FCOS study. Refer to the response to allocation of General Plant above.

Q44. HOW DOES EPE ALLOCATE DEPRECIATION AND AMORTIZATION EXPENSES TO DEC COMPONENTS?

A. EPE allocates depreciation and amortization expenses by the function consistent with the allocation of the associated plant and accumulated depreciation accounts.

Q45. HOW ARE INCOME TAXES ALLOCATED TO DEC COMPONENTS?

A. Consistent with the FCOS, deferred income taxes are allocated using a net plant allocator unless another function is specified in the tax code block details of that account. Current income taxes are calculated by DEC component based on the results of how other costs are classified.

Q46. HOW ARE TAXES OTHER THAN INCOME TAXES ALLOCATED TO DEC COMPONENTS?

A. Payroll and unemployment taxes are allocated based on a functional labor allocation factor. Assignment of property taxes to each DEC component is consistent with how each plant-in-service functional grouping is allocated. Revenue-related taxes are allocated on a functional rate base allocator if they are

associated with a specific function, or they are assigned to a specific DEC component labeled "Other" where they will later be assigned to jurisdiction and allocated to rate classes by a revenue allocator. Other taxes such as sales and use taxes are allocated based on a gross plant allocator.

Q47. WHY DOES EPE HAVE A DEC COMPONENT CALLED "OTHER"?

A. Similar to the "Other" function in the FCOS, the "Other" DEC Component is used for certain revenues or revenue-related items where the DEC Component is not known and where it does not make sense to allocate across DEC components. These items will be placed in the Other DEC Component as a placeholder to be assigned in the JCOS and CCOS.

Q48. IS THERE A SCHEDULE THAT PRESENTS HOW THE EXPENSES ARE ASSIGNED TO DEMAND, ENERGY, AND CUSTOMER?

A. Yes. Schedule K-7 presents the expenses by the Demand, Energy, and Customer component classifications. Refer to Workpaper K for the allocation details.

VI. JURISDICTIONAL COST-OF-SERVICE STUDY

Q49. WHY IS IT NECESSARY FOR EPE TO PRODUCE A JURISDICTIONAL COST-OF-SERVICE STUDY?

A. As described in the direct testimony of EPE witness George Novela, EPE is a multi-jurisdictional utility that provides service to customers in west Texas and southern New Mexico. To provide the revenue and cost data for EPE's New Mexico service area that is required for preparation of several Rule 530 schedules, specifically the K, M, and N Series schedules, it is necessary to first produce a jurisdictional cost-of-service study for the New Mexico retail jurisdiction. The JCOS serves as the foundation for the class cost-of-service study in which the revenue requirements are assigned to each rate class. The class cost-of-service study is discussed later in my testimony.

To meet the Schedule K Series requirements, a JCOS is produced for the Base Period and another for the Historical Test Year Period ("Test Year Period"). The Test Year Period JCOS includes all the adjustments discussed in the testimony of EPE witnesses Sierra and Prieto. Both the Base Period and the Test Year Period JCOS studies begin with total Company amounts which are then allocated amongst the jurisdictions as described below. Schedule/Workpaper A-3 provides the effect of each adjustment on the New Mexico jurisdiction.[1]

[1] The FERC account that the adjustment is made in will have a Base Period allocation factor applied to the per book balance amounts, followed by a Test Year Period allocation factor applied to the adjusted balance amounts. Therefore, the difference between jurisdictional adjusted balances and per book balances are not solely related to the known and measurable adjustments made but also to the difference in the applying two different sets of allocation factors to Base Period and to Adjusted (Test Year Period) balances.

Q50. WHAT IS REQUIRED TO PRODUCE A JCOS FOR THE NEW MEXICO JURISDICTION?

A. Following the functionalization and classification stages, jurisdictional responsibility is determined through either direct assignment or indirect allocation based on cost-causation principles.

If a cost specifically benefits a single jurisdiction (e.g., a distribution substation), it is directly assigned. For costs benefiting multiple jurisdictions, EPE develops allocation factors using jurisdictional operating data categorized by Demand, Energy, and Customer classifications. Key allocators used in the JCOS include:

- Demand: 4CP-A&E, 4CP, and 12CP-A&E allocation factors
- Energy: All kWh at supply or Firm kWh Only at supply
- Customer: Total Annual Customer counts
- Dynamic (internal) costs: Functionalized and Classified Labor, Plant, or Rate Base allocators
- Dynamic (internal) revenues: Determined on jurisdictional revenues

These factors represent the New Mexico retail portion as a percentage of the total company. When applied to revenue, expense, and rate base items, they derive the cost of service for the New Mexico and "Other" jurisdictions (which

consolidates Texas, FERC, and Other jurisdictions). These results then serve as the basis for further dynamic allocations within the model.

Q51. WHAT COSTS ARE DIRECTLY ASSIGNED IN THE JCOS?

A. When a cost is incurred on behalf of only one jurisdiction, that cost is directly assigned to that jurisdiction. For example, solar purchased power agreements ("PPAs") necessary to meet New Mexico renewable energy standards are directly assigned to New Mexico. Directly assigned costs include regulatory assets and items affected by the actions of specific regulatory bodies. For example, EPE is required to pay an annual commission assessment fee to the State of New Mexico to defray the cost of the NMPRC. This fee relates directly to the New Mexico jurisdiction, and it applies solely to New Mexico customers. Therefore, in this example, these costs are directly assigned to the New Mexico jurisdiction in the JCOS.

Q52. WHAT TYPES OF ALLOCATORS ARE USED IN THE JURISDICTIONAL COST-OF-SERVICE STUDY?

A. As mentioned previously, EPE uses two types of allocators: "input" and "dynamic." In the JCOS, input allocators include energy, demand, and customer allocators that come from another source and are either imported or manually input into the JCOS model. As prescribed by the NARUC Manual, the dynamic

allocators in the JCOS are derived from accounts that have already been allocated using a combination of allocators. Refer to Schedule M-1 for EPE's full list of jurisdictional allocation factors.

Q53. HOW ARE THE JURISDICTIONAL ENERGY, DEMAND, AND CUSTOMER ALLOCATION FACTORS DEVELOPED?

A. EPE witness Enedina Soto develops the demand and energy allocators as discussed in her direct testimony. The data for the customer allocators is provided by EPE witness Rene Gonzalez. These external allocators are then input into the UISG regulatory software module where the COS model can be run to produce the allocated results.

Q54. WERE ANY ADJUSTMENTS MADE TO THE ENERGY AND DEMAND ALLOCATION FACTORS FOR DEDICATED GENERATION FACILITIES?

A. Yes. Consistent with prior EPE rate case filings, adjustments were made to the jurisdictional energy and the production demand allocation factors to reflect certain dedicated facilities in New Mexico and Texas. EPE witness Soto addresses those adjustments in more detail in her direct testimony.

Q55. HOW ARE COSTS OF THOSE DEDICATED FACILITIES THAT ARE SOLAR PPAS RECOVERED FROM CUSTOMERS?

A. The cost of energy from PPAs in New Mexico that were entered into to meet renewable portfolio standard ("RPS") requirements are recovered directly from New Mexico customers through the RPS Cost Rider Rate No. 18. In Texas, EPE recovers the costs of energy from the 10-MW Newman Solar PPA from Texas customers through the fixed fuel factor and the Texas Community Solar program tariff.

Q56. HOW ARE COSTS FROM COMPANY-OWNED SOLAR GENERATION FACILITIES TREATED IN THE JURISDICTIONAL COST OF SERVICE?

A. EPE directly assigns costs of small, Company-owned solar facilities that are specifically dedicated to a certain state or jurisdiction. For example, the costs of the Company-owned small solar parking structure facility located at Rio Grande Generating Station is directly assigned to New Mexico.

Furthermore, any costs of Company-owned solar generation facilities that are specifically dedicated to a single customer are directly assigned to the Other jurisdiction since they are part of a special contract for that single customer and not shared by other customers. Similarly, for voluntary programs such as community or business solar, EPE directly assigns these costs to the Other

jurisdiction in the JCOS so that none of these costs or related indirect costs are allocated to New Mexico customers' base rates.

Q57. WHAT ARE THE COMPANY-OWNED SOLAR GENERATION FACILITIES THAT EPE DIRECTLY ASSIGNS TO NEW MEXICO?

A. The only Company-owned solar generation facility that EPE directly assigns to the New Mexico jurisdiction at this time is Rio Grande Solar (Carport).

Q58. WHAT METHOD IS USED TO ALLOCATE JURISDICTIONAL DEMAND-RELATED COSTS OF PRODUCTION?

A. In this filing, EPE proposes to continue the use of the 4CP methodology to allocate jurisdictional demand-related costs of peaking generation facilities with the exception of Newman Unit 6, which is not assigned to New Mexico. All other generation facilities will continue to be allocated using the 4CP-A&E methodology.

EPE's system peaks during the summer months of June through September. These monthly peak demands are mostly within 10% of the annual system peak demand, as shown in Exhibit AH-1. The production system is designed and built to meet both peak demand and EPE's energy requirements throughout the year. Therefore, EPE determined that the appropriate allocation for demand-related plant-in-service costs of production should be based on 4CP-

A&E and 4CP methodologies, consistent with EPE's Commission-approved allocations from its previous New Mexico rate case.

Q59. WHAT IS THE DIFFERENCE BETWEEN THE 4CP-A&E AND 4CP METHODOLOGIES?

A. The difference between the 4CP-A&E and the 4CP methodologies lies in how demand components are factored into each of the calculations. The 4CP-A&E methodology consists of both peak demand and annual average-demand components, while the 4CP methodology consists of just the peak-demand component. The specific calculations for each allocator are prepared under the supervision of EPE witness Soto.

Q60. HOW WERE JURISDICTIONAL DEMAND-RELATED PLANT-IN-SERVICE COSTS OF PRODUCTION ALLOCATED IN EPE'S PRIOR FILING?

A. EPE proposed the same methodology to use the 4CP to allocate the jurisdictional demand-related plant-in-service costs of its peaking generating facilities (identified as D2PROD in EPE's JCOS study) and the 4CP-A&E methodology to allocate the jurisdictional demand-related plant-in-service costs of all other generating facilities (D1PROD). These allocation proposals were approved by the NMPRC in Case No. 20-00104-UT.

Q61. HOW IS EPE HANDLING PALO VERDE GENERATING STATION ("PVGS") UNIT 3 ALLOCATION?

A. Since PVGS Unit 3 is not approved in New Mexico, any costs directly related to PVGS Unit 3 will not be allocated to New Mexico. In addition, one-third of PVGS Unit 3 Common and Water Resource Facility costs will be handled the same way and will not be allocated to New Mexico. Instead, one-third of PVGS Unit 3 common and water reclamation facility costs are allocated to the "Other" jurisdiction in the JCOS. The allocation factors that EPE will utilize for any PVGS Unit 3 related costs will be the following:

- D1PROD_PV3
- DPROD12_PV3
- E1ENERGY_PV3
- E1FUEL_PV3
- E2ENERGY_PV3

These above allocators will allocate as normal to Texas and FERC but New Mexico gets a zero percent allocation and that allocation goes to Other instead.

Q62. WHY HAS EPE DECIDED TO USE A 4CP ALLOCATION METHOD TO ALLOCATE JURISDICTIONAL DEMAND-RELATED

PLANT-IN-SERVICE COSTS OF PEAKING GENERATION FACILITIES?

A. EPE continues to use the 4CP allocation method for peaking generation to remain consistent with its previously approved proposal. These units are designed for intermittent use to meet summer peak load fluctuations rather than extended base-load operation. Since EPE's system peaks during the four summer months (June–September), the 4CP method accurately reflects the cost-causation of these assets. They are primarily operational during these peak windows and provide "load following" capabilities that are not required during off-peak periods. Further technical details on the performance of EPE's generation fleet can be found in the direct testimony of witnesses Hughes and Martinez.

Q63. WHAT ARE THE GENERATION FACILITIES THAT EPE CONSIDERS AS PEAKING UNITS FOR COST ALLOCATION PURPOSES?

A. EPE considers the following generation facilities as peaking units:

- Montana Power Station Units 1 through 4;
- Newman Unit 6;[2]
- Rio Grande Generating Station Unit 9; and
- Copper Generating Station.

[2] EPE is not requesting recovery of Newman Unit 6 in New Mexico.

Q64. DOES EPE HAVE ANY GENERATION FACILITIES THAT ARE AT OR NEAR FULL RETIREMENT?

A. Yes, EPE has four Steam Generation plants that are at or near full retirement. The following generation facilities are EPE's retiring plants:

- Newman Unit 1;
- Newman Unit 2;
- Rio Grande Unit 6; and
- Rio Grande Unit 7.

Q65. HOW IS EPE PROPOSING TO TREAT ITS RETIRING STEAM GENERATION PLANTS?

A. As discussed by EPE witness Prieto in her direct testimony, Rio Grande Unit 6 has been retired. Therefore, EPE will remove any costs related to Rio Grande Unit 6. The three remaining facilities are continuing to operate and will therefore be treated the same as in EPE's previous rate case in that they will be allocated to New Mexico using a 4CP-A&E allocation factor.

Q66. HOW IS EPE ABLE TO DISTINGUISH ALL OF THE FACILITIES WITHIN PLANT IN SERVICE IN ITS COST OF SERVICE?

A. EPE's UISG regulatory software module presents plant data using accounting code block detail specific to plant costs such as functional class, depreciation summary, and depreciation groups, which provide the user with enough information to make informed cost allocation decisions.

Q67. HOW DOES EPE ALLOCATE JURISDICTIONAL PLANT-IN-SERVICE COSTS FOR TRANSMISSION?

A. Most of EPE's transmission plant is treated by EPE as a single, integrated system that serves all jurisdictions regardless of geographic location. Because the transmission system is designed primarily to meet peak demand rather than energy requirements, these costs are allocated using the 4CP methodology. Specifically, the 4CP allocator (D2TRAN) captures system requirements during the four summer months (June through September) when EPE's peak demand occurs.

Q68. ARE THERE ANY TRANSMISSION PLANT-IN-SERVICE COSTS THAT ARE NOT ALLOCATED BETWEEN JURISDICTIONS?

A. Yes. Transmission costs related to the Felina Interconnection are not allocated among the jurisdictions. Instead, these costs are directly assigned to the Texas jurisdiction.

Q69. HOW ARE DISTRIBUTION PLANT-IN-SERVICE COSTS ALLOCATED IN THE JCOS?

A. Distribution plant-in-service costs in the JCOS are directly assigned based on geographic location. The only exception is for costs related to solar facilities that are dedicated to a single customer.

Q70. HOW ARE ENERGY STORAGE PLANT-IN-SERVICE COSTS ALLOCATED IN THE JCOS?

A. As mentioned previously, EPE's only energy storage facility is directly associated with a single customer and its solar facility. This facility is directly assigned to Other.

Q71. HOW IS EPE ALLOCATING METERS TO EACH JURISDICTION?

A. While EPE's advanced meters are currently recovered through a separate rider, EPE is proposing to incorporate these Advanced Metering System ("AMS") costs into base rates in this proceeding. Accordingly, EPE is directly assigning AMS rider revenues and associated expenses to the New Mexico jurisdiction. Any over- or under-recovered revenues, however, continue to be assigned to the "Other" jurisdiction.

Legacy meters (identified as Unrecovered Plant and Regulatory Study Costs in Schedule A-4) are directly assigned to their respective jurisdictions. Note that in

this proceeding, New Mexico legacy meters have been removed from the requested rate base per Adjustment 33.[3]

Q72. HOW ARE GENERAL PLANT-IN-SERVICE COSTS ALLOCATED IN THE JCOS?

A. General Plant-in-Service costs are allocated using labor allocation factors derived from payroll costs. Because EPE functionalizes and classifies its payroll as described previously, the JCOS can apply labor allocators that precisely align with the specific classification of the work performed. For instance, costs that were allocated via PRODLABOR in the DEC study are further refined into Demand Production and Energy-Other components. This granularity allows EPE to use specific demand allocators—D1PROD, D2PROD, and DPROD12—for their respective Demand Production components, and E1ENERGY for the Energy-Other component. By utilizing these specific DEC components, EPE ensures that general plant costs are allocated in a manner that directly reflects the underlying functional cost drivers.

Q73. HOW IS THE ACCUMULATED DEPRECIATION ALLOCATED IN THE JCOS?

[3] Refer to Unrecovered Plant and Regulatory Study Costs section of EPE witness Prieto's direct testimony.

A. Accumulated depreciation is allocated using functional class, depreciation summary, and depreciation group. This is the same methodology as the allocation of plant-in-service costs.

Q74. HOW ARE WORKING CAPITAL AMOUNTS ALLOCATED IN THE JCOS?

A. Costs under Prepayments or Materials and Supplies are allocated according to the DEC Component classification, or they are direct assigned if they related to a specific jurisdiction. Fuel inventory is allocated with E2ENERGY. Working Cash is calculated within the UISG regulatory solution, but the calculation uses the allocated jurisdictional result of its components (e.g., O&M, taxes, etc.).

Q75. IS THERE A SCHEDULE THAT SHOWS EPE'S JURISDICTIONAL RATE BASE?

A. Yes. Schedule K-1 summarizes all the rate base amounts and presents the jurisdictional allocation of each rate base item. For further line-by-line detail, please refer to Workpaper K.

Q76. HOW ARE DEMAND-RELATED PRODUCTION O&M EXPENSES ALLOCATED TO EACH JURISDICTION?

A. Demand-related production O&M expenses are allocated based on either the 4CP-A&E, 4CP, or 12CP-A&E allocator identified in the JCOS model as D1PROD, D2PROD, and DPROD12, respectively. The D1PROD allocator is applied to O&M expenses of all non-peaking generating facilities, and the D2PROD allocator is applied to O&M expenses of the peaking generating facilities. The DPROD12 allocator is applied to system control and dispatch expense.[4]

Finally, EPE typically treats battery capacity and other non-reconcilable purchased power costs (i.e., spinning reserves) as demand-related costs so it allocates those costs with the D1PROD allocator. However, it is important to note that in this proceeding EPE is direct assigning the costs related to Carne and Santa Teresa battery capacity as well as the Buena Vista battery deferred capacity costs to the New Mexico jurisdiction[5].

Q77. ARE THERE ANY ENERGY-RELATED PRODUCTION O&M EXPENSES?

A. Yes. Production O&M expenses that vary with the amount of energy produced are considered energy related. There are two types of energy-related production

[4] FERC Account 556 - System Control and Dispatching costs are incurred year-round; therefore, these costs are allocated using a 12CP-A&E allocator.
[5] Refer to Workpaper A-3 Adjustment 02 Fuel and Purchased Power Expense workpapers.

O&M expenses. The first type is fuel and purchased power expenses which are recovered through the Fuel and Purchased Power Cost Adjustment Clause ("FPPCAC") and the Renewable Portfolio Standards ("RPS) Rider. The second type of energy-related expenses are typically non-fuel expenses recovered in base rates.

Q78. WHAT ARE THE DIFFERENT ENERGY ALLOCATORS, AND HOW ARE THEY DEVELOPED?

A. EPE uses three different external allocators to allocate energy-related costs: E1ENERGY, E1FUEL, and E2ENERGY. E1ENERGY is used to allocate energy-related non-fuel production O&M expenses. E1FUEL is used to allocate fuel and purchased power expenses. E2ENERGY is used to allocate costs that may be fuel-related or driven by a fuel-related activity but are not recovered through the FPPCAC or RPS (i.e., fuel inventory or fuel-related Schedule M items within deferred taxes) riders.

EPE witness Soto develops the E1ENERGY allocator using kWh at supply excluding non-firm (interruptible) kWh. The E1FUEL and E2ENERGY allocators are also developed by EPE witness Soto using all kWh at supply (including non-firm).

Q79. HOW ARE ENERGY-RELATED PRODUCTION O&M EXPENSES ALLOCATED TO EACH JURISDICTION?

A. As discussed above, non-fuel O&M expenses are allocated to each jurisdiction on E1ENERGY. Reconcilable fuel and purchased power expenses are all allocated using E1FUEL. Non-reconcilable fuel and purchased power expenses that are not demand-related (such as the imputed capacity or spinning reserves discussed above) would be allocated using the E2ENERGY allocator.

Q80. IS EPE ALLOCATING PRODUCTION O&M DIFFERENTLY IN THIS CASE COMPARED TO ITS PREVIOUS RATE CASE?

A. No. EPE still uses the NARUC Cost Allocation Manual as a general guide for assigning demand and energy allocators. Demand-related production O&M expenses will be allocated (similar to production plant) using the 4CP or 4CP-A&E depending on the type of generation or direct assigned depending on the regulatory treatment of a specific generation facility. FERC Account 556 - Sys Control Load Dispatch is still allocated on 12CP-A&E.

Q81. HOW ARE TRANSMISSION O&M EXPENSES ALLOCATED AMONG THE JURISDICTIONS?

A. Most transmission O&M expenses are allocated based on the 4CP method. The 4CP allocator is identified as D2TRAN. The only exception is for FERC

Account 561 – Load Dispatching. Load dispatching costs are incurred year-round; therefore, these costs are allocated using a 12CP allocator, DTRAN12.

Q82. HOW ARE DISTRIBUTION O&M EXPENSES JURISDICTIONALLY ALLOCATED?

A. Distribution O&M expenses are either: (1) directly assigned to the respective jurisdiction that the expenses were incurred for; (2) allocated based on their respective plant investment in each jurisdiction; or (3) allocated on a dynamic allocator based on the costs contained in the other accounts of the operation or maintenance account grouping. The additional DEC Component detail provided from the DEC study allows EPE to allocate distribution costs with more accuracy.

Q83. HOW ARE CUSTOMER O&M EXPENSES ALLOCATED TO EACH JURISDICTION?

A. Customer Accounts and Customer Service & Information O&M expenses that are directly assignable are determined and directly assigned to the applicable jurisdiction. The remaining expenses in those accounts are allocated using customer allocators such as customer count. The only exception is FERC Account 904 – Uncollectible Accounts which is allocated using the firm base and fuel revenues of all customer classes except Other Public Authority and

Commercial and Industrial (C&I) Large in each jurisdiction (UNCOLL_REVS). EPE's allocation of uncollectible expense takes guidance from the Company's accounts receivable aging schedule to estimate bad debts. EPE's policy excludes Other Public Authority and C&I Large customers from the aging schedule. Therefore, EPE's allocation of uncollectible expense excludes these customers as well.

Costs in FERC Account 908 - Customer Assistance Expense are associated with EPE's AMS programs, so EPE direct assigns those to the jurisdiction specified in the accounting code block (project number).

Q84. HOW ARE A&G EXPENSES ALLOCATED AMONG THE JURISDICTIONS?

A. Most A&G expenses are allocated to a jurisdiction based on the LABOR allocation factor or another labor-related allocation factor derived from the labor expenses contained in the accounts of the applicable functional account grouping. A&G expenses related to a specific function (e.g., production, transmission, distribution) are allocated based on the function's assigned allocator. If an expense can be identified as benefiting a specific jurisdiction, then that expense is directly assigned to that jurisdiction (such as Regulatory Commission fees recorded in FERC Account 928 – Regulatory Commission Expenses).

Q85. HOW ARE THE DEPRECIATION AND AMORTIZATION EXPENSES JURISDICTIONALLY ALLOCATED?

A. EPE jurisdictionally allocates depreciation and amortization expenses by functional class, depreciation summary, and depreciation group consistent with the allocation of associated plant-in-service and accumulated depreciation amounts.

Q86. HOW IS THE AMORTIZATION OF LEGACY METERS ALLOCATED TO EACH JURISDICTION?

A. The amortization associated with legacy meters (identified as Amortization of Unrecovered Plant in Schedules A and A-1) is direct assigned consistent with the jurisdiction of those legacy meters. While EPE's legacy meters for New Mexico were removed from rate base, the amortization of those legacy meters is being requested in this proceeding as shown in Adjustment 13.[6]

Q87. HOW ARE REGULATORY DEBITS AND CREDITS ALLOCATED TO EACH JURISDICTION?

A. Regulatory debits and credits are assigned to each jurisdiction as specifically mandated by each jurisdiction's utility commission. Amortization on reacquired

[6] Refer to EPE witness Prieto's direct testimony, pages 71 and 72.

debt costs are allocated to jurisdiction based on Net Plant.

Q88. HOW ARE INCOME TAXES ALLOCATED TO EACH JURISDICTION?

A. Federal and state income taxes are split into two categories, current and deferred. Deferred federal and state income tax expenses are assigned an allocator based upon the underlying Schedule M item descriptions of the deferred income tax in the regulatory module. Most deferred federal and state income taxes are functionalized and classified using dynamic allocators based on dynamic allocators like NETPLANT, but since the costs is broken out by DEC component in the JCOS, it is allocated based on the DEC component classification. Current federal and state income taxes are calculated in the UISG regulatory module based on the allocated results of rate base and operating income. EPE witness Tamera Henderson discusses the calculation of the Company's income taxes.

Q89. HOW ARE TAXES OTHER THAN INCOME TAXES ALLOCATED TO EACH JURISDICTION?

A. Payroll and unemployment taxes are allocated based on the resulting functional and DEC component breakout of labor allocation factors, but in the JCOS they are allocated based on the DEC Component classification. Jurisdictional allocation of property taxes is consistent with how each plant-in-service functional grouping is allocated. Revenue-related taxes are directly assigned to the jurisdiction in which

such taxes are assessed; therefore, the New Mexico jurisdiction is not allocated any Texas revenue-related taxes. Other taxes such as sales and use taxes are allocated to jurisdiction according to the DEC Components cost breakout resulting from the functional and classification allocations of gross plant.

Q90. IS THERE A SCHEDULE THAT SHOWS EPE'S EXPENSES ON A JURISDICTIONAL BASIS?

A. Yes, Schedule K-5 summarizes how all the expenses are broken out by New Mexico and Other. For further line by line detail on JCOS allocations, refer to Workpaper K.

Q91. BASED ON THE JURISDICTIONAL COST-OF-SERVICE STUDY YOU HAVE DISCUSSED, WHAT IS THE NEW MEXICO REVENUE REQUIREMENT THAT EPE IS REQUESTING IN THIS CASE?

A. With reference to Schedule A-1 and Table AH-5 below, EPE has calculated a total cost of service for the New Mexico jurisdiction of $297.0 million. After adjusting that amount for fuel revenues and other operating revenues, the remaining $210.7 million base rate revenue requirement exceeds "as adjusted" base revenue of $140.1 million by $70.6 million (or 50.4 percent). The following table shows the results of the New Mexico jurisdictional cost of service:

Table AH-5

Line	Description	New Mexico Amount
1	Total Rate Base	$732,783,516
2	Weighted Average Cost of Capital ("WACC")	8.354%
3	Return on Rate Base	61,219,993
4	Fuel and Purchased Power	94,343,724
5	Operation and Maintenance (O&M)	68,166,298
6	Regulatory Debits and Credits	3,135,744
7	Depreciation & Amortization	47,063,658
8	Decommissioning and Accretion	749,740
9	Amortization of Unrecovered Plant	1,672,773
10	Taxes Other Than Income	9,494,814
11	Federal Income Taxes	9,747,518
12	State Income Taxes	1,391,828
13	**Total Cost of Service**	**296,986,090**
14	Less: Other Operating Revenues	(9,575,092)
15	Less: Fuel Revenues and Sales for Resale	(76,678,062)
16	**Base Rate Revenue Requirement**	**210,732,936**
17	Less: As Adjusted Base Revenues	(140,094,381)
18	**Base Rate Revenue Deficiency**	**70,638,555**
19	Percent Increase	50.42%

EPE's As Adjusted Base Revenues of $140,094,381 (shown on line 17 of Table AH-5 above) reflect the known and measurable adjustments to revenues that are discussed in more detail in the direct testimony of EPE witness Rene Gonzalez.

VII. CLASS COST-OF-SERVICE STUDY

Q92. PLEASE DESCRIBE THE NEW MEXICO RETAIL CLASS COST-OF-SERVICE STUDY MODEL.

A. The New Mexico CCOS study is the final phase of the sequential process that includes the FCOS, DEC, and JCOS studies. Once the New Mexico jurisdictional revenue requirements are fully functionalized and classified, the CCOS model assigns those costs to each retail rate class based on cost-causation principles. The resulting data provides the necessary foundation for developing EPE's class-specific rate design schedules.

Q93. WHAT IS REQUIRED TO PRODUCE A CCOS FOR THE NEW MEXICO JURISDICTION?

A. To produce the CCOS, EPE assigns jurisdictional costs to specific rate classes using either direct assignments or calculated allocation factors. For clearly identifiable costs—such as street lighting facilities—a direct assignment is made to the benefiting class. For all other costs, EPE utilizes class-level operating data to develop Demand, Energy, and Customer allocation factors.[7] These percentages are applied to the New Mexico jurisdictional revenue requirement to determine

[7] Demand and Energy Rate Class Allocation Factors are provided by EPE witness Soto and Customer Rate Class Allocation Factors are provided by EPE witness Rene Gonzalez.

the cost of service for each retail class.

Q94. WHAT ARE DIRECTLY ASSIGNED COSTS?

A. Directly assigned costs consist of those costs that are incurred specifically for certain rate classes. For example, EPE incurs costs for operating and maintaining streetlights (such as replacing burnt lamps); therefore, these costs are directly assigned to the Street-lighting rate class in the CCOS.

Q95. WHAT TYPES OF ALLOCATORS ARE USED IN THE CLASS COST-OF-SERVICE STUDY?

A. Similar to the JCOS study, the CCOS study employs both Input and Dynamic allocators. However, the recent enhancements to EPE's cost-of-service process has reduced the reliance on dynamic allocators in the CCOS. EPE has streamlined the CCOS study by leveraging JCOS results that are already functionalized and classified by DEC components. This pre-classification eliminates many of the indirect allocations in the CCOS like in EPE's previous COS model. This allows for a more direct and transparent flow of costs from the jurisdictional level to the retail class level.

Q96. IS EPE PROPOSING TO ADD OR REMOVE ANY RATE CLASSES IN THIS PROCEEDING?

A. No, EPE's CCOS in this proceeding will not add or remove any rate classes.

Q97. WHAT METHOD IS USED TO ASSIGN THE DEMAND-RELATED COSTS OF THE PRODUCTION PLANT-IN-SERVICE TO EACH RATE CLASS?

A. As explained in the JCOS section, EPE proposes to continue to use the 4CP methodology (D2PROD) for assigning demand-related costs of peaking generation facilities, and the 4CP-A&E methodology (D1PROD) for assigning demand-related costs of all other generation facilities. The CCOS uses these allocators to assign demand-related production costs to each rate class.

Q98. HOW ARE THE DEMAND-RELATED COSTS OF TRANSMISSION PLANT-IN-SERVICE ASSIGNED TO EACH RATE CLASS?

A. Consistent with the JCOS study, transmission plant is assigned to each rate class using the 4CP allocator D2TRAN.

Q99. HOW IS THE DEMAND-RELATED COST OF DISTRIBUTION PLANT-IN-SERVICE ASSIGNED TO EACH RATE CLASS?

A. EPE uses the Maximum Class Demand ("MCD") to assign substation and primary distribution feeder system costs and Non-Coincident Peak Demand ("NCP") to assign secondary voltage distribution feeders and line transformer costs.

Q100. HOW ARE MCD AND NCP DEVELOPED, AND WHAT DO THEY REPRESENT?

A. EPE witness Soto develops the MCD and NCP. In general, MCD represents the diversified loads of a rate class at the system peak; NCP represents the summation of the maximum loads of each customer within a rate class, regardless of when those loads occur.

Q101. WHY DOES EPE USE BOTH THE MCD AND NCP ALLOCATORS FOR DISTRIBUTION PLANT?

A. These distribution plant allocators are based on the level of voltage at which service is received. The cost causation for the distribution system differs for each voltage level; therefore, EPE developed allocation factors for each of these levels to reflect the type of loads that most significantly influence the costs at that level. The MCD is appropriate for the primary voltage plant because the primary distribution system serves all distribution level customers. The NCP Demand allocator is a measurement of maximum attainable peak demand by each rate class, independent of the class or system peak. This method allocates costs to serve customers based on their diversity at the more localized secondary distribution system.

Q102. HOW ARE DISTRIBUTION PLANT-IN-SERVICE ACCOUNTS RELATED TO SUBSTATIONS (NOS. 360 THROUGH 362) ASSIGNED TO EACH RATE CLASS?

A. Distribution Plant Account No. 360 - Land and Land Rights, Account No. 361 - Structures and Improvements, and Account No. 362 - Station Equipment costs are assigned based on the MCD allocator described previously. The MCD allocator (D3DIST, D4DIST, D7DIST, or D9DIST) reflects the responsibility and costs to the customers served downstream from substations.

Q103. HOW ARE DISTRIBUTION PLANT-IN-SERVICE ACCOUNT NOS. 364 THROUGH 368 ASSIGNED TO RATE CLASSES?

A. Costs for Distribution Plant Account No. 364 - Poles, Account No. 365 - Overhead Conductors, Account No. 366 - Underground Conductors, Account No. 367 - Underground Conduits, and Account No. 368 - Line Transformers are separated based on the distribution voltage level served. The primary voltage level costs are assigned to rate classes using the MCD allocator. The secondary voltage level costs are assigned based on the NCP allocator (D5DIST, D6DIST, D8DIST, or D10DIST).

Q104. HOW IS THE CUSTOMER-RELATED COST OF DISTRIBUTION

PLANT-IN-SERVICE ASSIGNED TO EACH RATE CLASS?

A. EPE also assigns costs for services on a service drop investment allocator (SDI) and costs for meters based on a weighted non-AMS meter cost allocator (NON-AMS_METER) or based on a weighted AMS meter cost allocator (AMS_METER). Lighting-related facilities are directly assigned to the associated rate class such as street lighting or private area lighting.

Q105. HOW DOES EPE ASSIGN COSTS FOR ACCOUNT NO. 369 – SERVICES TO EACH RATE CLASS?

A. Account No. 369 – Services, e.g., costs of service drop from the distribution system to serve customers, is assigned to rate classes based on the Service Drops ("SDI") allocator provided to me by EPE witness Rene Gonzalez. This method creates the SDI allocator based on the number of services per rate class weighted by the typical cost to provide a service drop to that rate class.

Q106. WHAT ALLOCATOR(S) DOES EPE USE FOR ACCOUNT NO. 370 - METERS?

A. EPE utilizes two distinct meter allocators in the CCOS study: the Non-AMS Weighted Meter Allocator (NON-AMS_METER) and the AMS Weighted Meter Allocator (AMS_METER). As supported by EPE witness Rene Gonzalez, these allocators are designed to reflect cost causation by weighing the actual meter

count for each class by the typical unit cost.

This weighting ensures that costs are assigned proportionally to the specific class and level of service driving the expense. For example, large-use customers often require sophisticated Interval Data Recorder ("IDR") meters, which are significantly more expensive than standard residential energy meters. By applying a higher "weight" to these IDR meters, the model more accurately assigns the higher equipment costs to the classes that use them.

Q107. HOW ARE GENERAL PLANT-IN-SERVICE COSTS ASSIGNED TO EACH RATE CLASS?

A. Since the allocated results of general plant from prior steps are already known by Function and DEC Component, the assignment of allocators in the rate class step can be more specifically allocated with demand, energy, or customer allocators.

Q108. HOW IS THE ACCUMULATED DEPRECIATION RELATED TO THE PLANT-IN-SERVICE COSTS ASSIGNED?

A. Accumulated depreciation amounts are assigned to each rate class using an allocation factor commensurate with the plant account that these amounts are associated with.

Q109. HOW ARE WORKING CAPITAL AMOUNTS ASSIGNED TO EACH

RATE CLASS?

A. Materials and Supplies are allocated according to the function specified in the account code block description. Fuel inventory is allocated with E2ENERGY. Prepayments are allocated according to the function specified in the account code block description. Consistent with the allocation in the JCOS, Working Cash is calculated using the allocated results of its components (e.g., O&M, taxes, etc.).

Q110. IS THERE A SCHEDULE THAT SHOWS HOW ALL RATE BASE AMOUNTS ARE ASSIGNED TO EACH RATE CLASS?

A. Yes. Schedule K-4 summarizes all the rate-base costs and how they are assigned to each rate class. For further details refer to Workpaper K.

Q111. HOW ARE POWER PRODUCTION EXPENSES ASSIGNED TO EACH RATE CLASS?

A. Reconcilable fuel and purchased power related expenses are allocated on the energy allocator E1FUEL. Non-fuel energy-related power production expenses are allocated using E1ENERGY. The remaining demand-related power production expenses are allocated based on either the 4CP-A&E allocator (D1PROD); 4CP allocator (D2PROD); or 12CP-A&E allocator (DPROD12).

Q112. HOW ARE TRANSMISSION O&M EXPENSES ASSIGNED TO EACH

RATE CLASS?

A. Consistent with the JCOS, FERC Account 561 – Load Dispatching expenses are allocated using a 12CP allocator (DTRAN12). All other transmission O&M expenses are assigned to each rate class with the D2TRAN allocator.

Q113. HOW ARE DISTRIBUTION O&M EXPENSES ASSIGNED TO EACH RATE CLASS?

A. Since the DEC Components are known in the CCOS, the process of assigning rate class allocators to Distribution O&M costs is simplified. For example, Account No. 580 - Supervision and Engineering and Account No. 588 - Misc. Distribution Expenses used to be allocated on dynamic allocator EXP_5817 (based on Accounts 581 through 587), but now a more direct allocator can be determined using the known DEC Component classifications for these accounts.

Q114. HOW ARE CUSTOMER ACCOUNTS (ACCOUNT NOS. 901 – 905) AND CUSTOMER SERVICE & INFORMATION O&M (ACCOUNT NOS. 906 – 910) EXPENSES ASSIGNED TO EACH RATE CLASS?

A. Account No. 901 - Supervision and Account 905 - Miscellaneous Customer Expenses are assigned to each rate class using a dynamic allocator based on Accounts 902 and 903. Account No. 902 - Meter Reading Expenses are based on a non-AMS meter-related allocation factor and Account Nos. 903 - Customer

Records and Collections is assigned to rate classes using a customer-count allocation factor. Account No. 908 - Customer Assistance Expenses is allocated based on the weighted AMS meter allocator.

As previously discussed, Account No. 904 - Uncollectible Accounts expenses are assigned based on the firm base and fuel revenues of each rate class, except for those rate classes that are not subject to account write-offs such as governmental customers or C&I Large customers.

Q115. HOW ARE ADMINISTRATIVE AND GENERAL EXPENSES ASSIGNED TO EACH RATE CLASS?

A. In the past, most A&G expenses were assigned to rate classes using a labor-related allocation factor derived from the payroll expenses contained in the accounts of the applicable functional account grouping. However, A&G expenses in the CCOS are now presented with a known Function and DEC classification so a specific allocator directly associated with the DEC Component can be assigned.

Q116. HOW ARE THE DEPRECIATION AND AMORTIZATION EXPENSES ASSIGNED TO EACH RATE CLASS?

A. EPE assigns depreciation and amortization expenses to each rate class by relying on functional class, depreciation summary, and plant description consistent with the assignment of plant-in-service and accumulated depreciation costs.

Q117. HOW ARE REGULATORY DEBITS AND CREDITS ASSIGNED TO EACH RATE CLASS?

A. If there are any regulatory debits and credits assigned to the New Mexico jurisdiction, they are allocated depending on the DEC Component of the specific debits and credits.

Q118. HOW ARE TAXES OTHER THAN INCOME TAXES ASSIGNED TO EACH RATE CLASS?

A. Payroll and unemployment taxes are assigned to rate classes based on labor, but in the CCOS, that labor allocation has been broken out into function and DEC component so the assignment to rate class is directly based on the functional classification of those payroll and unemployment taxes. The same could be said for the assignment of property taxes, which are allocated to each rate class based on a gross plant allocation that are now directly associated with DEC Components. Revenue-related taxes are also allocated based DEC Component, but any proposed increases are calculated. Other taxes such as sales and use tax are allocated with a gross plant allocator, but similar to property taxes, they can be allocated more directly using the Function and DEC classification.

Q119. HOW ARE INCOME TAXES ALLOCATED TO EACH RATE CLASS?

A. The deferred federal and state income taxes are allocated to rate class by using the known Function and DEC classification to choose the allocator that directly related to the DEC Component. Current federal and state income taxes are calculated at the rate class level in the model like they were in previous steps of the COS.

Q120. IS THERE A SCHEDULE THAT SHOWS HOW EXPENSES ARE ASSIGNED TO RATE CLASSES?

A. Yes. Schedule K-8 also summarizes all the expenses items and how they were assigned to each rate class. For further detail, refer to Workpaper K.

Q121. HOW DOES THE CCOS ALLOCATE THE NON-FIRM, FUEL, AND OTHER OPERATING REVENUES TO EACH RATE CLASS?

A. Non-firm revenue is allocated to rate classes using the D2PROD allocator. The reason is because non-firm revenues from interruptible customers are used in order to reduce peak demand. As previously discussed, D2PROD is the 4CP allocator used to allocate peaking-generation units.

Fuel revenues are adjusted to match the reconcilable fuel and purchased power expenses of each rate class, net of off-system sales. The reconcilable fuel

and purchased power expenses and off-system sales fuel costs are allocated to each rate class with the E1FUEL allocator.

Other Operating Revenues are allocated to each rate class with various allocators depending on the function specified. For example, Miscellaneous Service Revenues are allocated with the distribution or customer-related allocators and Forfeited Discounts are allocated similar to uncollectible expense.

EPE's revenues are discussed in the direct testimony of EPE witness Rene Gonzalez. These revenues (non-firm, fuel-related, and other operating revenues) are credited against the Total Cost of Service to arrive at the firm Base Rate Revenue Requirement of each rate class.

Q122. HOW IS THE CLASS COST-OF-SERVICE STUDY PRESENTED IN THE FILING?

A. Schedule N-1 summarizes the cost of service for the New Mexico rate classes.

Q123. WHAT SCHEDULE SUMMARIZES THE OVERALL RESULTS OF DEMAND, ENERGY, AND CUSTOMER COMPONENTS STUDY FOR EACH RATE CLASS?

A. Schedule L-1 summarizes the results of the DEC Study by rate class and calculates the DEC components on a cost-per-unit basis.

Q124. PLEASE SUMMARIZE THE OVERALL RESULTS OF THE PROPOSED NEW MEXICO CLASS COST-OF-SERVICE STUDY.

A. Table AH-6 below lists the results of the non-fuel cost assignment to each proposed rate class from the CCOS (not including non-firm revenues). The values shown are at equalized rate of return (full cost of service). The proposed allocation of revenue requirements and rate design is discussed and presented in the testimony of EPE witness Carrasco.

Table AH-6

Rate	Description	Base Revenue Deficiency @ Equalized Rate of Return*	Percent Increase Required
01	Residential	$53,508,944	73.18%
03	Small General Service	1,590,360	7.55%
04	General Service	5,659,990	28.29%
05	Irrigation Service	1,913,910	57.03%
07	City & County	1,819,134	40.99%
08	Water/Sewage Pumping	519,451	24.95%
09	Large Power Service	1,998,795	26.33%
10	Military Service – A	920,100	36.26%
10	Military Service – B	1,222,475	79.95%
11	Street Lighting	(23,790)	-6.85%
12	Area Lighting	540,823	59.03%
19	Seasonal Agriculture	(115,314)	-10.34%
25	Recreational Lighting	48,489	81.70%
26	State University	1,035,188	57.37%
Total*		$70,638,555	50.47%

*The base revenue deficiency amounts above do not include non-firm revenues.

VIII. ALTERNATIVE CLASS COST-OF-SERVICE ILLUSTRATION FOR RATE NO. 7

Q125. WHY ARE YOU PRESENTING AN ALTERNATIVE ILLUSTRATION OF THE CCOS?

A. Per the Final Order from Case No. 20-00104-UT, EPE was required to submit an alternative cost of service that assumes reopening Rate No. 07 (City & County) to new customers. Therefore, EPE will illustrate the results of a CCOS as if Rate No. 07 were open to new customers and assuming any customers eligible for Rate No. 07 will be included under Rate Class 07.

Q126. HOW DID YOU PUT TOGETHER THE ALTERNATIVE CCOS ILLUSTRATION?

A. I created a new scenario in the UISG regulatory software module, but using different annualized revenues and customer allocators from EPE witness Rene Gonzalez moving customers out of other rate classes (mostly rate classes 03, 04, and 09) and into Rate Class 07. Also, I used an alternative set of demand and energy allocation factors provided to me by EPE witness Soto. This new set of revenues and class allocation factors assumes that any customers that would have been eligible for Rate No. 07 if the rate was open, are included as part of Rate Class 07 in terms of their revenues, consumption, customer count, etc.

Q127. WHAT WERE THE RESULTS?

A. Refer to the results in Exhibit AH-2. The illustration shows the per kWh rate for each rate class at full cost of service. Table AH-7 below provides a comparison

of Rate Nos. 3 and 7 because Rate No. 3 would be the qualifying rate for many customers if they are not eligible to take service under a reopened Rate No. 7.

Table AH-7

Rate Class	Full Cost of Service	Billing Determinants	Full Cost
	($)	(kWh)	($/kWh)
Rate 3	22,119,827	203,022,875	0.1089524
Rate 7	9,349,455	81,192,961	0.1151511
		Differential ($/kWh)	0.0061987
		(%)	0.0568936

The table shows no significant disparity exists in the cost of serving Rate No. 7 and Rate N

The results show that there is no cost basis for having a separate rate class for government

IX. SUMMARY AND CONCLUSION

Q128. PLEASE SUMMARIZE YOUR TESTIMONY.

A. The JCOS for the Test Year ended September 30, 2025, results in a total revenue requirement of $297.0 million and a base rate revenue requirement of $210.7 million for the New Mexico jurisdiction. The base revenue deficiency is $70.6 million.

The CCOS shows the assignment of the revenue requirements discussed above to each rate class. Table 5 summarizes the CCOS, and the resulting rate increase required to achieve an equalized rate of return across rate classes. The resulting firm base revenue requirements (net of non-firm revenues) for each class are shown on line 1 of Schedule N-1 and the results for each rate class by DEC Component are shown in Schedule L-1.

Q129. IN YOUR OPINION, ARE THE ALLOCATION METHODS AND THE RESULTS OF THE ALLOCATIONS EMPLOYED IN EPE'S COST-OF-SERVICE STUDIES FAIR AND REASONABLE?

A. Yes. The allocation methods employed in EPE's cost-of-service studies are fair and reasonable and accurately present the costs to serve each jurisdiction and rate class. Furthermore, the methods that have been employed in conducting the cost-of-service studies utilize well-reasoned methods which are commonly employed in the electric utility industry.

Q130. DOES THIS CONCLUDE YOUR TESTIMONY?

A. Yes, it does.

EL PASO ELECTRIC COMPANY, Applicant.	)	

DECLARATION OF ADRIAN HERNANDEZ IN SUPPORT OF THE FOREGOING DIRECT TESTIMONY TO THE APPLICATION OF EL PASO ELECTRIC COMPANY FOR REVISION OF ITS RETAIL ELECTRIC RATES PURSUANT TO ADVICE NOTICE NO. 317

I, ***Adrian Hernandez***, pursuant to Rule 1-011 NMRA, state as follows:

1. I affirm in writing under penalty of perjury under the laws of the State of New Mexico that the following statements are true and correct.

2. I am over 18 years of age and have personal knowledge of the facts stated herein. I am employed by El Paso Electric Company ("EPE" or "the Company") as the *Supervisor – Revenue Requirements and Cost Analysis.*

3. The foregoing Direct Testimony of Adrian Hernandez, together with all exhibits sponsored therein and attached thereto, is true and accurate based on my knowledge and belief.

4. I submit this Declaration, based upon my personal knowledge and upon information and belief, in support of EPE's ***Application for Revision of Its Retail Electric Rates Pursuant to Advice Notice No. 317.***

FURTHER, DECLARANT SAYETH NAUGHT.

I declare under penalty of perjury that the foregoing is true and correct.

Executed on March 27, 2026.

/s/ Adrian Hernandez

EL PASO ELECTRIC COMPANY
DIRECT TESTIMONY OF
RENE F. GONZALEZ

I. INTRODUCTION AND QUALIFICATIONS

Q1. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Rene F. Gonzalez, and my business address is 100 North Stanton Street, El Paso, Texas, 79901.

Q2. HOW ARE YOU EMPLOYED?

A. I am employed by El Paso Electric Company ("EPE" or the "Company") as Supervisor - Rates and Regulatory.

Q3. PLEASE SUMMARIZE YOUR EDUCATIONAL AND PROFESSIONAL QUALIFICATIONS.

A. I hold a bachelor's in business administration with a double major in Economics and Finance from The University of Texas at El Paso and a Master of Arts in Economics with a concentration in Public Utility Policy & Regulation from New Mexico State University ("NMSU").

I have worked with EPE in the Rate Research section of the Regulatory Affairs group since October 2012. I was first hired as an Associate Rate Analyst. In November 2014, I earned a progressive promotion to Staff Financial Analyst and in October of 2016 was promoted to Senior Rate Analyst. Finally, I was promoted to my current position as a Supervisor - Rates and Regulatory, in September 2020.

In addition to my education and professional experience described above, I have attended professional development seminars covering rate design, marginal cost, load research statistical applications, and transmission and distribution systems.

Q4. PLEASE DESCRIBE YOUR CURRENT RESPONSIBILITIES WITH EPE.

A. As Supervisor in the Rate Research section, my responsibility is to supervise the preparation of economic, customer, statistical, and cost studies and analysis; to develop models and methodologies for cost of service, profitability, and pricing studies; and to conduct annualization, jurisdictional and class cost of service studies, and revenue forecasts.

Q5. HAVE YOU PRESENTED TESTIMONY BEFORE UTILITY REGULATORY BODIES?

A. Yes, I have previously filed testimony and testified before the New Mexico Public Regulation Commission ("NMPRC" or "Commission") and the Public Utility Commission of Texas.

II. PURPOSE OF TESTIMONY

Q6. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. My testimony presents EPE's adjustments to billing determinants and the computation of Historical Test Year Period revenues at present rates based on those determinants. I also discuss EPE's proposals to revise rate schedules, qualifying services, and attendant billing provisions; the cost of service and rate design of the street and private area lamps, changes to the lighting rate schedules; and updates to miscellaneous service charges.

Q7. ARE YOU SPONSORING ANY EXHIBITS IN YOUR TESTIMONY?

A. Yes. I am sponsoring the following exhibits, which are attached to this testimony:

- Exhibit RFG-1: Adjustment of Base Revenues Summary
- Exhibit RFG-2: 2024 and 2025 Projected Annual Savings
- Exhibit RFG-3: Energy Efficiency Program Annualization Adjustment
- Exhibit RFG-4: Rate No. 18 – FPPCAC Voltage Factors Calculation; and
- Exhibit RFG-5: Miscellaneous Charge Comparison.
- Exhibit RFG-6: Example of Distribution Capacity Reservation Charge

Q8. WHAT RULE 17.9.530 ("RULE 530") SCHEDULES DO YOU SPONSOR OR CO-SPONSOR?

A. I sponsor or co-sponsor Schedule O-2 Proof of Revenue Analysis (at present rates); Schedule O-4 Explanation of proposed changes to existing rate Schedules; and Schedule P-5 Customer Information.

Q9. WERE THE EXHIBITS AND SCHEDULES YOU ARE SPONSORING PREPARED BY YOU OR UNDER YOUR DIRECT SUPERVISION?

A. Yes, they were.

III. ADJUSTMENT TO BASE-RATE REVENUE

A. OVERVIEW

Q10. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?

A. In this section of my testimony, I discuss EPE's adjustments to its non-fuel operating revenues (i.e., Base, and Other Operating Revenues). These adjustments apply to the New Mexico jurisdiction and are shown in Schedule A-1 as the difference between Base Period (October 1, 2024, through September 30, 2025) and Base Period As Adjusted, the Adjustments column (c). Adjustments to EPE's fuel operating revenues are discussed in the Direct Testimony of EPE witness Adrian Hernandez.

Q11. ARE ADJUSTMENTS TO BASE PERIOD DATA RECOGNIZED FOR A HISTORICAL TEST YEAR PERIOD UNDER NMPRC RULE 530?

A. Yes. The Rule 17.9.530.7.C of the New Mexico Administrative Code ("NMAC") provides the definition of adjustments for general rate cases.

Q12. WHAT TYPE OF ADJUSTMENTS HAVE BEEN MADE TO EPE'S BASE PERIOD DATA TO DETERMINE HISTORICAL TEST YEAR PERIOD BASE REVENUES?

A. In order to ensure that the test year is indicative of what is likely to occur under normal, recurring operating conditions, EPE has annualized and normalized Base Period billing and usage data to determine Historical Test Year Period base revenues at present rates. These adjustments, tabulated in Exhibit RFG-1, are explained below and primarily enumerate the impact of (1) annualizing test year-end customer growth or decline; (2) billing determinants that have been adjusted to reflect normal weather; (3) annualizing the impact of Commission-approved energy efficiency programs implemented during the base period; and (4) other known and measurable changes. The Historical Test Year Period billing and usage data are inputs into the jurisdictional and the class cost-of-service study ("CCOS") allocations and form the basis for the billing determinants on which rates are designed. An explanation for these adjustments is provided later in this section.

The adjustments to other operating revenues are also explained later in this section of my testimony. I co-sponsor workpaper Adj. No. 1 to Schedule A-3, which contains the revenue adjustments I describe in this testimony.

Q13. HOW ARE REVENUES FROM THE SPECIAL RATE CONTRACTS WITH HOLLOMAN AIR FORCE BASE AND NEW MEXICO STATE

UNIVERSITY HANDLED IN THIS FILING?

A. Revenues from the special rate contracts with Holloman Air Force Base and New Mexico State University ("NMSU") are excluded from the per book New Mexico jurisdiction revenues. This is consistent with the handling of all costs related to the EPE-owned solar photovoltaic generation facilities located within Holloman Air Force Base and NMSU. The Special Rate Contract revenues associated with the EPE-owned facilities for both Holloman Air Force Base and NMSU are non-base rate revenues, and therefore, not included in the calculation of base rates or as jurisdictional revenues in New Mexico.

Q14. WERE BILLING AND USAGE ADJUSTMENTS MADE TO ALL JURISDICTIONS SERVED BY EPE?

A. Yes. Adjusting the billing and usage of all jurisdictions served by EPE ensures that the Company's total cost of service is properly allocated to all jurisdictions.

B. ADJUSTMENTS TO BASE REVENUES (SCH. A-1, COLUMN (c), LINE 1)

1. TEST YEAR-END CUSTOMER ANNUALIZATION

Q15. WHAT IS THE TEST YEAR-END CUSTOMER ANNUALIZATION?

A. The year-end customer annualization is the process by which Base Period data are adjusted to account for known and measurable changes in the number of customers or known energy and demand usage changes.

Q16. WHAT IS THE PURPOSE OF CUSTOMER ANNUALIZATIONS?

A. The purpose of annualizing Base Period customers, revenues, sales, and demand is to adjust these items to a level representative of ongoing conditions had the number of customers at the test year-end been served for the entire twelve-month period.

Q17. WHICH RATE CLASSES WERE ANNUALIZED FOR TEST YEAR-END CUSTOMERS?

A. The following New Mexico rate classes exhibited a significant change in total number of customers or energy and demand usage during the Test Year Period, making them subject to an annualization adjustment:

- Residential Service,
- Small General Service,
- General Service,
- Irrigation,
- City and County Service,
- Water, Sewage, and Storm Sewage Pumping Service, and
- Large Power Service.

Some rate classes exhibited less significant changes but were also subject to an annualization adjustment:

- Street Lighting Service,
- Private Area Lighting Service, and
- Seasonal Agricultural Processing.

Q18. WHAT IS THE REVENUE ADJUSTMENT DUE TO THE TEST YEAR-END CUSTOMER ANNUALIZATION ADJUSTMENT?

A. The table below summarizes the adjustment to base revenues at present rates and billing determinants resulting from the test year-end customer annualization adjustment.

Table RFG - 1

Adjustment To:	New Mexico Amount
Base Revenue	$609,421
Billed Kilowatt-Hour (kWh)	9,536,530
Billed Kilowatt (kW)	8,074
Annual Customers	6,767

2. WEATHER NORMALIZATION

Q19. WHY ARE BASE PERIOD BILLING DETERMINANTS AND REVENUE WEATHER NORMALIZED?

A. Base Period billing determinants and revenue are normalized to reflect normal weather conditions.

Q20. WHICH RATE CLASSES WERE WEATHER NORMALIZED?

A. The energy sales of the following New Mexico rate classes were weather normalized:

- Residential Service,
- Small General Service,
- General Service,
- Irrigation Service,
- City and County Service,
- Water, Sewage, and Storm Sewage Pumping Service,
- Military R&D Service, and
- State University Service.

Q21. WHAT IS THE REVENUE ADJUSTMENT DUE TO WEATHER NORMALIZATION?

A. During the Base Period, energy sales were lower than normal by approximately 14 million kWh due to the weather, thus an adjustment to increase base revenue was made. The following table summarizes the adjustment to base revenues at present rates and billing determinants resulting from the weather normalization adjustment.

/

/

/

Table RFG - 2

Adjustment To:	New Mexico Amount
Base Revenue	$1,231,376
Billed kWh	13,904,903

Q22. WHY IS NO ADJUSTMENT MADE TO BILLED KW FOR WEATHER?

A. The individual customer's non-coincident kW load of heating and cooling equipment is not weather sensitive. Billed kW is based on non-coincident kW load, a minimum kW, or a ratcheted kW amount.

Q23. PLEASE DESCRIBE EPE'S WEATHER NORMALIZATION METHODOLOGY.

A. See the Direct Testimony of EPE witness Enedina Soto for support and a description of the technical approach that EPE's Load Research and Data Analytics team applies in normalizing energy consumption for the effect of weather.

The weather normalization revenue adjustment that I apply is based on the data provided by Ms. Soto. This calculation simply applies the proper energy charge to each rate class's energy sales adjustment.

3. ENERGY EFFICIENCY PROGRAM ANNUALIZATION

Q24. IS THE PROPOSED ENERGY EFFICIENCY ANNUALIZATION

ADJUSTMENT CONSISTENT WITH THE ADJUSTMENT THE COMMISSION APPROVED IN EPE'S MOST RECENT RATE CASE?

A. Yes. The adjustment applied in this filing is the same adjustment applied in EPE's most recent rate case, Case No. 20-00104-UT. EPE's proposed energy efficiency annualization was first approved by the Commission's Final Order in Case No. 15-00127-UT (the "2015 Rate Case") and was calculated in the same manner as proposed in this case.

Q25. PLEASE DESCRIBE THE ADJUSTMENT FOR THE IMPACT OF NEW MEXICO ENERGY EFFICIENCY PROGRAMS.

A. The Efficient Use of Energy Act ("EUEA") requires public utilities to include Commission-approved, cost-effective energy efficiency and load management programs as part of their energy resource portfolios. The programs for the 2024 and 2025 calendar years were approved by the Commission in Case No. 21-00114-UT and Case No. 24-00154-UT. In those filings, the projected kWh annual savings from the installed measures for the 2024 and 2025 program years amounted to 22,075,287 kWh and 17,214,020 kWh, respectively (see Exhibit RFG-2), or an average of 19,644,654 kWh.[1]

[1] See Case No. 21-00114-UT, Exhibit ADM-1, *El Paso Electric's 2022-2024 Energy Efficiency and Load Management Plan*, prepared by Frontier Energy and attached to the Direct Testimony of Amy Martin, and Case No. 24-00154-UT, Exhibit DRN-1, *El Paso Electric's 2025-2027 Energy Efficiency and Load Management Plan*, also prepared by Frontier Energy and attached to the Direct Testimony of Derek R. Neumann.

Preliminary analysis of the installed energy efficiency measures for the months in the 2024 and 2025 program years that fall within the test year for this case show that the actual annual energy savings reflecting full customer participation at the end of the Test Year Period is 8,107,359 kWh. To recognize the impact of the implementation of these energy efficiency programs, energy billing determinants for the New Mexico jurisdiction were annualized by reducing kWh sales by 4,610,825 kWh to reflect kWh savings for the full twelve-month period of the Test Year Period. Actual savings from the installed measures that are included in recorded billed energy during the Base Period are estimated at 3,496,534 kWh. Exhibit RFG-3 provides the detailed calculations of the kWh adjustment for the impact of New Mexico energy efficiency programs.

The table below summarizes the base revenue adjustments at present rates resulting from energy savings brought about by the approved energy efficiency programs.

Table RFG - 3

Adjustment To:	**New Mexico Amount**
Base Revenue	($213,104)
Billed kWh	(4,610,830)

Q26. WHAT IS THE SOURCE OF INFORMATION FOR THE ENERGY

EFFICIENCY ANNUALIZATION ADJUSTMENT?

A. I obtained the information for the energy efficiency annualization adjustment from EPE's Energy Efficiency Department. The Energy Efficiency Department compiles energy savings based on program expenditures throughout the year, which are then verified by the Commission-approved Measurement and Verification (M&V) Evaluator. As of the writing of this testimony, the annual energy savings from the preliminary analysis of the installed measures for the 2024 program year have been verified by the M&V Evaluator; however, results from the 2025 program year are pending.

4. OTHER KNOWN AND MEASURABLE CHANGES

Q27. WHAT IS THE REVENUE ADJUSTMENT DUE TO OTHER KNOWN AND MEASURABLE CHANGES?

A. Adjustments due to other known and measurable changes are summarized in the following table.

Table RFG - 4

Adjustment To:	New Mexico Amount
Base Revenue	$1,035,691
Billed kWh	9,089,932

Out-of-period adjustments were made to per book data to account for energy recorded during the Base Period that is associated with months outside of the Test Year Period. Due to the seasonal rate structures of some rate classes, out-of-period adjustments are also made to months within the Test Year Period. Out-of-period adjustments are sometimes needed due to missed meter reads or incorrect input of the meter reading data for a month prior to the Test Year Period, which were corrected in bills issued during the Base Period. In addition, adjustments to Base Period bills corrected in months after the Test Year Period ended were reflected in the Historical Test Year Period. Base revenue was increased by $1,035,691 for these out of period adjustments.

Q28. ARE THERE ANY OTHER ADJUSTMENTS MADE TO BASE REVENUES?

A. Yes. Unbilled base revenues, which are intended to recognize revenue for estimated consumption yet to be billed in a month, are removed from base revenues. In the current Base Period, EPE recorded $106,807 in unbilled base revenue for New Mexico. This adjustment decreased the amount of recorded base revenue.

5. BASE REVENUE ADJUSTMENT SUMMARY

Q29. WHAT ARE THE HISTORICAL TEST YEAR PERIOD BASE REVENUES RESULTING FROM THESE ADJUSTMENTS?

A. The table below summarizes the New Mexico jurisdiction base revenues at present rates resulting from these adjustments. Please note that Per Book Base Revenue (top line) and Adjusted Base Revenue (last line) include AMS Surcharge revenues and are itemized in Exhibit RFG-1. Additionally, Schedule O-2 Proof of Revenue, at Present Rates, provides the rate by rate details accounting for the adjusted base revenue.

Table RFG - 5

	New Mexico
Per Book Base Revenue *	$136,620,420
Base Revenue Adjustments:	
Test Year-End Customer Annualization	609,421
Weather Normalization	1,231,376
Energy Efficiency Program Impact	(213,104)
Other Known and Measurable Changes	1,035,691
Unbilled Base Revenues	(106,807)
Annualized AMS Surcharge	$784,807
Total Base Revenue Adjustments	$3,341,383
Adjusted Base Revenue (at present rates)	$139,961,803

***** Includes unbilled and AMS Surcharge Per Book; excludes NMSU and Holloman Air Force Base special rate contract revenue.

C. ADJUSTMENT TO OTHER OPERATING REVENUES (SCH. A-1, COLUMN (c), LINE 11)

Q30. DESCRIBE THE ADJUSTMENT TO OTHER OPERATING REVENUES?

A. The $228,165 adjustment to increase Other Operating Revenues is the result of two types of adjustments: annualization of miscellaneous charge revenue, and the effect of the change in allocation factors.

Miscellaneous charge revenue annualization increase Other Operating Revenue by $7,057 to remove the effect of an out of period adjustment. The remaining $221,108 adjustment to Other Operating Revenues reflects the effect of the change in allocation factors from per book to adjusted values on Other Operating Revenues. For example, Base Period revenue from rental of electric property is allocated to New Mexico using the per book LABOR allocation factor, which is determined using per book labor expenses. To arrive at the Test Year Period amount of this revenue, the adjusted LABOR allocation factor is applied. The adjusted LABOR allocation factor is determined using test year labor expenses that reflect the known and measurable changes described by EPE witness Steven A. Sierra.

Please note that prior to the two adjustments discussed above, and consistent with the base period adjustment to PVGS operation and maintenance costs (i.e., reduced to reflect the elimination of expenses related to PVGS Unit 3 and 1/3 Common, as described in Adjustment No. 5 by EPE witness Sierra), one-third

of revenue related to PVGS sale of surplus effluent water is removed from per book other operating revenues. This adjustment amounted to a reduction in total company per book Other Operating Revenues of $49,387.

IV. RATE SCHEDULE PROVISION REVISIONS

A. OVERVIEW

Q31. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?

A. In this section of my testimony, I discuss the more significant revisions to EPE's existing rate schedules that are proposed in this proceeding. The changes to the rate schedules are described below and a more detailed discussion about these changes is provided in Schedule O-4. Additionally, redlined versions of the rate schedules are included as a workpaper to Schedule O-4.

Q32. HOW DOES THIS SECTION OF YOUR TESTIMONY RELATE TO THE TESTIMONY OFFERED BY EPE WITNESS MANUEL CARRASCO?

A. I address the proposed changes to the language of all of EPE's rate schedules, as well as the proposed rates and rate structures of four rate schedules: Rate No. 11 – Street Lighting Service, Rate No. 12 – Private Area Lighting Service, Rate No. 15 – Miscellaneous Service Charges, and Rate No. 16 concerning purchases from qualifying facilities which I also address below. The Direct Testimony of EPE witness Manuel Carrasco addresses EPE's rate design proposals and proposed

modifications to existing rates and rate structures for all of EPE's rate schedules except for the four rate schedules addressed by me and those in the nature of riders.

Q33. IN ADDITION TO REVISING THE APPLICABLE BASE RATES AND STRUCTURES, IS EPE PROPOSING ANY OTHER SIGNIFICANT CHANGES TO ITS RETAIL RATE SCHEDULES IN THIS RATE CASE?

A. Yes. EPE is proposing language changes to clarify and improve the structure of the rate schedules and better align the language between certain rate schedules applicable in EPE's New Mexico and Texas service territories to ensure consistency in the criteria applied to the electric service in both service territories.

Q34. ARE THERE ANY GLOBAL LANGUAGE CHANGES APPLICABLE TO ALL OR MOST PROPOSED RATE SCHEDULES?

A. Yes. There are five global language changes applicable to all or most of the proposed rate schedules. First, with respect to Distributed Generation ("DG") customers, EPE is adding verbiage establishing the TOD periods in the 'Fuel and Purchased Power' ("FPPCAC") provision.

Second, EPE is proposing to revise the 'Monthly Minimum Charge' provision language to more clearly reflect its application.

The third language change is applicable to several rate schedules that include a primary voltage rate. EPE witness Omar Gallegos testifies that one or

more EPE customers with significant load have requested an additional service primary voltage feed and related distribution facilities as a back-up to their initial service feed facilities to ensure a continuous supply of power (i.e., back-up feeder), effectively reserving capacity on EPE's distribution system and limiting access to that capacity to other potential customers. To prevent other customers from subsidizing the costs of such requests, EPE is proposing to implement a Reserved Distribution Capacity Service Charge, which will be billed to customers that make such new requests. Customers will be required to enter into an agreement with the Company for a contracted amount of reserved capacity, in kW, that will be billed until such time that the customer no longer requires a back-up feeder. The Reserved Distribution Capacity Service Charge rate is the same as the primary voltage Demand Charge, under the applicable rate option that the service requiring back-up is billed under.

The fourth language change applicable to most of the proposed rate schedules includes the removal of *applicability* language previously included at the beginning of most tariffs as it is related to the timing of the first bills for usage of TOD rates and the reprogramming of associated meters and was specific to NMPRC Case No. 20-00104-UT.

The fifth and final global change is the removal of the Voluntary Renewable Energy ("VRE") Program Rate No. 32 notations, where applicable, within any tariffs. VRE Program Rate No. 32 was approved for discontinuation, and the tariff

was therefore eliminated via Case No. 21-00111-UT, effective January 1, 2022.

I refer to these five language changes as the "broadly applicable language changes" later in my testimony.

Q35. ARE ALL EXISTING RATE SCHEDULES DESCRIBED BELOW?

A. No. Only rate schedules that contain language changes other than broadly applicable language changes described just above and base rates, are included in my testimony below.

Q36. PLEASE SUMMARIZE THE RATE SCHEDULES AND ASSOCIATED DETAILS THAT ARE DESCRIBED BELOW.

A. In aid of the comprehensive testimony that follows, the table below is included as a summary, in order, of the written descriptions provided of the rate schedule language revisions.

/

Table RFG - 6

Tariff	*SC	**LC	Proposed New Options/Additions	Rate Amt.
Rate No. 01 Residential Service		X	Low income rider (LIR)	X
Rate No. 03 - Small General Service	X	X	Off-peak demand rider	X
Rate No. 04 - General Service		X	Reserved Distribution Capacity Service Charge	X
Rate No. 07 - City and County Service		X	Reserved Distribution Capacity Service Charge	X
Rate No. 09 - Large Power Service		X	Reserved Distribution Capacity Service Charge	X
Rate No. 10 - Military Research and Development		X		X
Rate No. 16 - Purchased Power			Proposing new super off-peak payment tier	
Rate No. 18 – Fuel and Purchased Power Cost Adjustment Clause (FPPCAC)		X	Includes newly proposed Line Loss Factors	X
Rate No. 26 - State University Service		X		X
Rate No. 29 - Noticed Interruptible Power Service Rate for Large Power Service		X	Open to new customers / economic alternative	X
Rate No. 42 - Experimental Electric Vehicle Charging Rate		X		X
Rate No. 41 - Federal Tax Credit Factor			Eliminate rider	
Rate No. 11 - Street Lighting		X	New Lamps	X
Rate No. 12 - Private Area Lighting		X	New Lamps	X

* Structural Change

** (Tariff) Language Change - Other than Global Changes Applicable to All Tariffs

Q37. PLEASE ITEMIZE RATE SCHEDULES NOT INCLUDED IN THE ABOVE TABLE OR DESCRIBED IN TESTIMONY BELOW.

A. The following rate schedules are not described or included in subsequent testimony as indicated within question 35 above. However, also noted above, a more detailed discussion for all rate schedules is provided in Schedule O-4.

- Rate No. 05 - Irrigation Service,
- Rate No. 08 - Water Pumping Service,
- Rate No. 19 - Seasonal Agricultural Processing Service,
- Rate No. 21 - Supplementary Power Service,
- Rate No. 22 - Backup Power Service,

- Rate No. 23 - Maintenance Power Service,
- Rate No. 24 - Interruptible Power Service,
- Rate No. 25 - Outdoor Recreation Lighting Service,
- Rate No. 30 - Load Retention Rate,
- Rate No. 39 – Economic Development Rate,
- Rate No. 47 – Community Solar Program Credit Rate, and
- Rate No. 47.1 Community Solar Program Administrative Cost Rider.

Rate No. 39 – Economic Development Rate is experiencing no change except for a version update to coincide with the new advice notice. Also, regarding Rate No. 47 – Community Solar Program Credit Rate, please refer to Section O below, for further discussion on this rate schedule.

Q38. HAVE YOU PROVIDED COPIES OF THE PROPOSED RATE SCHEDULES?

A. Yes. Pursuant to 17.1.210 NMAC, EPE's proposed base rates and language changes are presented in the rate schedules attached to Advice No. 317.

B. RATE NO. 01 - RESIDENTIAL SERVICE

Q39. PLEASE DESCRIBE THE EXISTING RATE NO. 01 – RESIDENTIAL SERVICE RATE SCHEDULE.

A. The Rate No. 01 – Residential Service Rate schedule is applicable to single-family residences or individually metered apartments for primarily domestic or home use. The rate schedule includes two monthly rate options: Standard Service Rate and TOD Rate. A clause is included that offers bill protection to customers that elect to take service under the TOD Rate for an initial twelve-month period under that rate option.

The rate schedule also includes a provision for a monthly minimum charge, and it includes reference to other applicable riders, as well as terms and conditions that apply to service under this schedule. A Whole House Electric Vehicle ("WHEV") Rate Rider Incentive Credit is currently offered under the rate schedule.

Q40. HOW HAS THE BILL PROTECTION CLAUSE ENCOURAGED PARTICIPATION IN THE TOD RATE OPTION?

A. Rate No. 01 offers a bill protection clause that removes the risk of severe bill impact in the initial twelve months after a customer switches to the TOD Rate option. If, at the conclusion of the initial 12-month period of service under the TOD rate option, the total billings exceed billings for the same period under the Standard Service rate, the customer may opt to revert to the Standard Service rate. In this event, the Company will reset the customer's account to the Standard Service rate and provide a credit to the customer for the difference in billings under the TOD Rate option and the Standard Service rate for the 12-month review period.

Since EPE's last rate case and effective the test year end (September 30, 2025), approximately 117 customers are participating in the TOD Rate Option.

Q41. OTHER THAN THE BROADLY APPLICABLE LANGUAGE CHANGES, WHAT SIGNIFICANT LANGUAGE CHANGES ARE PROPOSED SPECIFICALLY FOR RATE NO. 01?

A. EPE is proposing to implement a Low-Income Rider ("LIR") provision under Rate Schedule No. 01. The LIR is intended to provide a waiver of the monthly Customer Charge for qualifying customers.

Q42. WHY IS EPE PROPOSING THE LIR?

A. EPE has long had a Low-Income Rider in Texas, designed to function exactly as proposed in this case, where the customer charge, at its prevailing rate, is credited to qualifying low-income residential customers. After 2025 legislative changes in New Mexico that allow the Commission to approve "rates and programs designed to reduce the burden of energy costs on low-income customers", EPE is proposing a low-income rider to assist qualifying low-income residential customers in New Mexico as well as to mirror our Texas jurisdiction.

Q43. HOW ARE RESIDENTIAL CUSTOMERS QUALIFIED FOR ELIGIBILITY FOR THE LIR?

A. Residential customers of record or authorized individuals on an account with EPE who are authorized to receive Supplemental Nutrition Assistance Program ("SNAP") or Low Income Heating Assistance Program ("LIHEAP") benefits in New Mexico, pursuant to the eligibility and assistance requirements of the SNAP and LIHEAP programs, are qualified to receive the LIR. Customers will be identified by EPE using the New Mexico Human Services Department New Mexico Health Care Authority (HCA) client database and for the period of time in which they are authorized for SNAP or LIHEAP assistance, or for twelve (12) months, whichever is less.

C. RATE NO. 03 - SMALL GENERAL SERVICE

Q44. PLEASE DESCRIBE THE EXISTING RATE NO. 03 – SMALL GENERAL SERVICE RATE SCHEDULE.

A. The Rate No. 03 – Small General Service Rate schedule is applicable for service to customers with monthly peak demands less than 50 kW. The rate schedule includes four monthly rate options: Standard Service Rate, Alternative Service Rate (non-demand rate for customers with monthly peak demands less than 15 kW and energy consumption not exceeding 7,000 kWh), Standard TOD Rate, and Alternative TOD Rate. The rate schedule includes a provision for determination of billing demand and for monthly minimum charge, provisions for applicable riders, as well as terms and conditions that apply to service under this schedule. A Whole Service Electric

Vehicle ("WSEV") Rate Rider Incentive Credit is currently offered this rate schedule incentivizing consumption during super off-peak hours crediting participants for energy usage during these hours up to a limit of total energy usage. Finally, as with Rate No. 01, this rate contains a bill protection clause offering bill protection to customers that elect to take service under the TOD Rate for an initial twelve-month period.

Q45. OTHER THAN THE BROADLY APPLICABLE LANGUAGE CHANGES, WHAT SIGNIFICANT LANGUAGE CHANGES ARE PROPOSED SPECIFICALLY FOR RATE NO. 03?

A. For the Alternative TOD Rate No. 03, EPE is proposing a new Experimental Off-Peak Demand Rate. This proposed change is intended to encourage maximum demand use during the off-peak period. Additional information regarding this proposal can be seen within the Direct Testimony of EPE witness Carrasco.

D. RATE NO. 04 - GENERAL SERVICE

Q46. PLEASE DESCRIBE THE EXISTING RATE NO. 04 – GENERAL SERVICE RATE SCHEDULE.

A. The Rate No. 04 – General Service Rate schedule is applicable for service to customers with monthly peak demands of 50 kW and above but less than 800 kW. The rate schedule includes two monthly rate options: Standard Service Rate and

TOD Rate. The rate schedule also includes provisions for determination of billing demand and power factor and meter voltage adjustments, provisions for applicable riders, as well as terms and conditions that apply to service under this schedule. Both the Standard Service Rate and TOD Rate include rates that are differentiated for service at secondary, primary and transmission voltage levels. The rate schedule currently includes a Thermal Energy Storage ("TES") Rider provision. A WSEV Rate Rider Incentive Credit is also currently offered on this rate schedule.

Q47. IS EPE PROPOSING ANY LANGUAGE CHANGES SPECIFIC TO RATE NO. 04?

A. Yes. Like Rate No. 03, EPE is proposing a new Experimental Off-Peak Demand Rate. Details regarding this proposal can also be seen within the Direct Testimony of EPE witness Carrasco.

E. RATE NO. 07 - CITY AND COUNTY SERVICE

Q48. IS EPE PROPOSING TO CONTINUE OFFERING SERVICE UNDER RATE NO. 07 - CITY AND COUNTY SERVICE?

A. Yes, EPE is proposing to continue offering service under this special rate schedule to existing customers currently taking service under this schedule. This schedule was closed to new customers effective January 2010 following approval of EPE's 2009 Rate Case. Since closure of the rate schedule, all new service which otherwise

may have qualified for service on Rate No. 07 has taken service under the other applicable rate schedules.

Q49. PLEASE DESCRIBE THE EXISTING RATE NO. 07 – CITY AND COUNTY SERVICE RATE SCHEDULE.

A. The Rate No. 07 – City and County Service Rate schedule is applicable to public schools and municipal and county customers, except water and sewage facilities. Rate No. 07 is a long-standing rate class that differentiates City and County customers, so called public authority customers, within their own rate class, encompassing a variety of consumption levels or differing sized accounts. The rate schedule contains a single monthly rate option and includes a provision for determination of billing demand, provisions for applicable riders, as well as terms and conditions that apply to service under this schedule. The rate schedule currently includes a Thermal Energy Storage ("TES") Rider provision.

Q50. IS EPE PROPOSING ANY LANGUAGE CHANGES SPECIFIC TO RATE NO. 07?

A. No.

F. RATE NO. 09 - LARGE POWER SERVICE

Q51. PLEASE DESCRIBE THE EXISTING RATE NO. 09 – LARGE POWER

SERVICE RATE SCHEDULE.

A. The Rate No. 09 – Large Power Service Rate schedule is applicable for service to customers with monthly peak demands of 800 kW and above. The rate schedule contains a single monthly time varying rate option and includes provisions for determination of billing demand and power factor and meter voltage adjustments, provisions for applicable riders, as well as terms and conditions that apply to service under this schedule. The rate includes rates that are differentiated for service at secondary, primary and transmission voltage levels. The rate schedule also currently includes a TES Rider provision.

Q52. IS EPE PROPOSING ANY LANGUAGE CHANGES SPECIFIC TO RATE NO. 09?

A. No.

G. MILITARY RESEARCH AND DEVELOPMENT

Q53. PLEASE DESCRIBE THE EXISTING RATE NO. 10 – MILITARY RESEARCH AND DEVELOPMENT POWER RATE SCHEDULE.

A. The Rate No. 10 – Military Research and Development Power Rate schedule is available only to military installations whose primary mission is research and development with a minimum contracted billing demand of 6 MW. Participants are required to contract for service for 10 years. The rate schedule contains two

monthly time varying rates, a Standard Service Rate and an Enhanced Service Rate accounting for a photovoltaic ("PV") system. The rate schedule includes provisions for determination of billing demand and temporary off-peak demand and site-specific metering adjustments, provisions for applicable riders, as well as terms and conditions that apply to service under this schedule.

Q54. HOW MANY CUSTOMERS DOES EPE SERVE UNDER RATE NO. 10?

A. EPE has two customers served under Rate No. 10: White Sand Missile Range and Holloman Air Force Base.

Q55. IS EPE PROPOSING ANY LANGUAGE CHANGES SPECIFIC TO RATE NO. 10?

A. No.

H. PURCHASED POWER

Q56. PLEASE DESCRIBE THE EXISTING RATE NO. 16 – PURCHASED POWER SERVICE SCHEDULE.

A. The Rate No. 16 – Purchased Power Service schedule is applicable to qualifying facilities which qualify as small production and cogeneration facilities as defined in Title 18 of the Code of Federal Regulations ("C.F.R."), Part 292, Subpart B, of the final rules issued by the Federal Energy Regulatory Commission to implement Sections 201 and 210 of the Public Utility Regulatory Policy Act of 1978. The

schedule includes the energy payment rates, differentiated by voltage, and time-of-day, due to qualifying facilities from EPE for any energy sales to EPE. The methodology for Rate No. 16 was updated to comply with Commission's amended Rule 17.9.570 NMAC, which was adopted on April 20, 2022, in Case No. 20-00175-UT. The current version of Rate No. 16 was approved by Commission Final Order on June 20, 2024, in Case No. 23-00222-UT.

Q57. WHAT CHANGES ARE PROPOSED FOR RATE NO. 16 AND ITS ENERGY PAYMENT RATES?

A. EPE is not proposing changes to Rate No. 16 though it is requesting to add a super off-peak payment tier to better align with the more detailed interval data in use with new Advanced Metering System ("AMS") meters to the energy payment rates resulting from the schedule. Energy payments are updated monthly pursuant to 17.9.570.9(A) and paid consistent with 17.9570.11(B)(1)(a) NMAC (Rule 570). Additionally, a super off-peak tier would help to align with at least one rate treatment associated with the final order for Case No. 24-00113-UT implementing a Time Varying Rate Pilot Program ("TVRPP") for Pilot Residential Time-Varying Rate No. 48 and Pilot Small General Service Time-Varying Rate No. 49.

Q58. WHAT SIGNIFICANT LANGUAGE CHANGES ARE PROPOSED SPECIFICALLY FOR RATE NO. 16?

A. No language changes are proposed for Rate No. 16, rather, EPE's proposal would add a super off-peak payment tier to the monthly tabulation of the purchased power rates. The tabulation and reporting of the monthly amounts are a requirement of the Commission final order in Case No. 23-00222-UT. The calculation of this new payment tier will occur by using the same data in use now, though it will be calculated on the specific time frame defining super off peak which is currently embedded in the calculation of the off-peak rate.

I. FUEL AND PURCHASED POWER COST ADJUSTMENT CLAUSE

Q59. PLEASE DESCRIBE THE EXISTING RATE NO. 18 – FUEL AND PURCHASED POWER COST ADJUSTMENT CLAUSE SCHEDULE.

A. The Rate No. 18 – Fuel and Purchased Power Cost Adjustment Clause ("FPPCAC") schedule applies to all rate schedules that contain a provision for Rate No. 18. Since billable FPPCAC rates are calculated monthly, this rate schedule simply lists the line losses and voltage factor to use in the monthly FPPCAC rate calculation.

Q60. WHAT CHANGES ARE PROPOSED FOR RATE NO. 18 LINE LOSS AND VOLTAGE FACTORS?

A. EPE is proposing to update the line loss factors listed in Rate No. 18. The line loss factors listed in Rate No. 18 reflect the loss factors from the 2021 EPE Line Loss Study, which is discussed in the Direct Testimony of EPE witness Soto and

proposed for approval in this filing.

The voltage factors listed in Rate No. 18 are based on these line loss factors, and change based on those loss factors. These voltage factors are used in the calculation of the monthly FPPCAC that is billed to customers. Exhibit RFG-4 provides the calculation of the proposed voltage factors for this schedule.

Q61. WHAT SIGNIFICANT LANGUAGE CHANGES ARE PROPOSED SPECIFICALLY FOR RATE NO. 18?

A. EPE is not proposing any language changes to Rate No. 18.

J. STATE UNIVERSITY SERVICE

Q62. PLEASE DESCRIBE THE EXISTING RATE NO. 26 – STATE UNIVERSITY SERVICE.

A. The Rate No. 26 – State University Service Rate schedule is applicable to any public college or university's main campus with expected monthly demand exceeding 6 MW. The rate schedule contains a single monthly time varying rate option and includes provisions for determination of billing demand and power factor and meter voltage adjustments, provisions for applicable riders, as well as terms and conditions that apply to service under this schedule.

Q63. IS EPE PROPOSING ANY LANGUAGE CHANGES SPECIFIC TO RATE

NO. 26?

A. No.

K. NOTICED INTERRUPTIBLE POWER SERVICE RATE FOR LARGE POWER SERVICE

Q64. PLEASE DESCRIBE THE EXISTING RATE NO. 29 – NOTICED INTERRUPTIBLE POWER SERVICE FOR LARGE POWER CUSTOMERS SCHEDULE.

A. This rate has been closed to new customers through the Commission's Final Order in Case No. 09-00171-UT (the "2009 Rate Case"). EPE is proposing to open the tariff and limit the total company interruptible capacity to 100 MW. The Rate No. 29 – Noticed Interruptible Service Rate for Large Power Service rate schedule is available to current Customers with total connected capacity requirements of at least 1,000 kW and not served at a transmission voltage level. The minimum level of firm demand required from qualifying Customers is 500 kW. This schedule is available only in conjunction with firm service under other applicable rate schedules. The rate schedule contains a single monthly time varying rate option and includes provisions for determination of billing demand and power factor and meter voltage adjustments, provisions for applicable riders, as well as terms and conditions that apply to service under this schedule. The rate includes rates that are differentiated for service at secondary and primary voltage levels.

Interruptible customers effectively provide a capacity resource equal to the difference between their contracted firm service level and their full load requirement. Within 30 minutes of a notice by EPE to interrupt, the customer is required to reduce their demand to their firm service level, subject to penalties provided in the rate schedule.

Q65. HOW MANY CUSTOMERS DOES EPE SERVE UNDER RATE NO. 29?

A. EPE has three customers served under Rate No. 29. These customers provide approximately 1.5 to 2 MW of interruptible capacity.

Q66. WHAT SIGNIFICANT LANGUAGE CHANGES ARE PROPOSED SPECIFICALLY FOR RATE NO. 29?

A. EPE is proposing to increase total company interruptible capacity to 100 MW, by opening the rate schedule to new customers until such load level is achieved. The opening of this rate schedule helps to further EPE's pursuit of demand side opportunities in reducing peak demand.

No other significant language changes are proposed for this rate schedule. Additional information on this proposed change is included in Schedule O-4 and discussed in the Direct Testimony of George Novela.

Q67. WHAT WERE THE RESULTS OF THE MEDIATION REQUESTED FOR

RATE NO. 29 IN THE RECOMMENDED DECISION AND FINAL ORDER OF CASE NO. 20-00104?

A. Pursuant to section XXII decretal paragraphs, item T, of the recommended decision in Case No. 20-00104-UT of EPE's last rate case, EPE filed Case No. 21-00307-UT on December 17, 2021. EPE requested and was appointed a mediator for EPE and interested persons to discuss possible modifications to Rate No. 29, Notice Interruptible Service Rate for Large Power Service, to make it more effective in reducing peak demand.

On June 28, 2022, the Mediator's Report outlining the events and outcome of the mediation were filed with the Commission. As stated in the report, "no agreement as to potential recommendations has been reached, the "mediation" provided an opportunity for the participants to "discuss," as ordered, relatively informally, their various positions". Further the three ratepayers directly subject to Rate No. 29 were notified and had the opportunity to participate in the discussion.

L. EXPERIMENTAL ELECTRIC VEHICLE CHARGING RATE

Q68. PLEASE DESCRIBE THE EXISTING RATE NO. 42 – EXPERIMENTAL ELECTRIC VEHICLE CHARGING RATE SCHEDULE.

A. The Rate No. 42 – Experimental Electric Vehicle Charging Rate schedule is available to new and existing customers. This rate schedule is available, on a voluntary basis, to residential and commercial customers that have a separately

metered facility dedicated solely for the charging of electric vehicles.

The rate schedule includes definitions of terms, a monthly rate provision, provisions for applicable riders, as well as terms and conditions that apply to service under this schedule. Additional details are included below in support of the rate and in compliance with the Recommended Decision of Case No. 20-00104-UT, EPE's most recent rate case. Specifically, they address the questions asked in Item V. of the Decretal Paragraphs.

Q69. HOW MANY CUSTOMERS DOES EPE SERVE UNDER RATE NO. 42?

A. This question and answer is provided pursuant to section XXII decretal paragraphs, item V, of the recommended decision in Case No. 20-00104-UT of EPE last rate case.

As of the end of the Test Year Period (September 30, 2025), 38 customers are being served under this rate.

The breakdown by rate class is as follows:

- Residential: 2,
- Commercial & Industrial Small: 23, and
- Public Authority: 13.

Q70. WHAT IS THE MAXIMUM NUMBER OF CUSTOMERS THAT HAVE

RECEIVED SERVICE UNDER RATE NO. 42 AT ANY ONE TIME SINCE THE EFFECTIVE DATE OF THE RATE?

A. This question and answer is provided pursuant to section XXII decretal paragraphs, item V, of the recommended decision in Case No. 20-00104-UT of EPE last rate case.

The maximum number of customers served at any point since the inception of the rate is 38, though that number has grown to 41, as of December 31, 2025, post the Test Year Period of this case.

Q71. WHAT IS THE AVERAGE BILL FOR RATE NO. 42 CUSTOMERS?

This question and answer is provided pursuant to section XXII decretal paragraphs, item V, of the recommended decision in Case No. 20-00104-UT of EPE last rate case.

The average bill for all Rate No. 42 customers, for all bills, since the inception of the tariff, is $116.11. The first customer was billed in February 2022. Additional testimony on load data and the load profile of Rate No. 42 customers is found in the Direct Testimony of EPE witness Soto.

Q72. IS EPE PROPOSING ANY LANGUAGE CHANGES SPECIFIC TO RATE NO. 42?

A. Yes. The charging activity operating voltage limitations are eliminated. The latter

is being done to allow flexibility that ensures that not only EV chargers but also supporting infrastructure installed for EV chargers such as small lights or cameras can be placed on the same meter. This is also consistent with recent proposed changes for a similar tariff in EPE's Texas jurisdiction.

M. COMMUNITY SOLAR PROGRAM CREDIT RATE

Q73. PLEASE DESCRIBE THE EXISTING RATE NO. 47 – COMMUNITY SOLAR PROGRAM CREDIT RATE SCHEDULE.

A. The Rate No. 47 – Community Solar Program Credit Rate schedule is a voluntary rate schedule available to all rate classes as an alternative to rooftop solar, created to promote participation in renewable energy solutions.

The rate schedule includes definitions of terms, a monthly rate provision, and terms and conditions.

Q74. IS EPE PROPOSING TO REVISE THE FIXED COMMUNITY SOLAR PROGRAM CREDIT RATES OF RATE NO. 47?

A. Not at this time. Appendix A, within the tariff, will be modified to revise the fixed CSP Credit Rates of the tariff. Pursuant to the community solar rule, 17.9.573.20(C), and as agreed to the methodology prescribed by the NMPRC in its Phase II Final Order in Docket No. 23-00071-UT, the Company will calculate the Fixed CSP Credit Rate for each New Mexico retail service rate schedule with every

change in base rates after the initial implementation of Rate No. 47 – Community Solar Program Credit Rate. Upon final determination of the cost of service and base rates in this proceeding, EPE will file a modified Rate No. 47 with respect to the fixed CSP Credit Rate of this tariff.

N. RATE SCHEDULES PROPOSED FOR CLOSURE

Q75. IS EPE PROPOSING TO CLOSE ANY RATE SCHEDULES.

A. Yes. EPE proposes the closing of the Federal Tax Credit Factor, Rate No. 41, rate schedule. This rate was originally implemented via final order in Case No. 18-00016-UT with an effective date of May 1, 2018, with a term to be discontinued upon the effective date of rate in EPE's next base rate case. During the subsequent rate case, Case No. 20-00104-UT, the rate was newly revised with an effective date of July 10, 2021, for a new 3-year, 36-month term. This tariff has now run its course and is complete.

O. OTHER RATES

Q76. ARE THERE ANY OTHER RATES NOT INCLUDED FOR DISCUSSION IN THIS TESTIMONY OR ITEMIZED IN THE ANSWER TO QUESTION 37 ABOVE?

A. Yes. Newly approved Pilot Residential Time-Varying Rate No. 48, and Pilot Small General Service Time-Varying Rate No. 49, are not included as they are pilot rates

later being evaluated for future update. Also, the Efficient Use of Energy Recovery Factor (EUERF), Renewable Portfolio Standard (RPS) Cost Rider, Rate No. 38, Transportation Electrification Plan (TEP) Cost Rider, Rate No. 44, and Advanced Metering System Rider (AMS), Rate No. 46, are not included as they are each filed individually for annual update or compliance.

V. LAMP LIGHTING COST OF SERVICE AND RATE DESIGN

A. OVERVIEW

Q77. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?

A. In this section of my testimony, I present the cost of service and rate design for the street and private area lighting rate classes. I also discuss the more significant revisions to EPE's existing lighting rate schedules which are proposed in this proceeding. The more significant changes to these rate schedules are described below and further discussion about changes is provided in Schedule O-4. Additionally, redlined versions of the rate schedules are included as a workpaper to Schedule O-4.

Q78. DESCRIBE THE PROCESS OF PREPARING THE LIGHTING COST OF SERVICE AND THE RATE DESIGN FOR THE LIGHTING RATE CLASSES.

A. The process of preparing the lighting cost of service begins with the results of the

CCOS. Following that, a determination is made, through the revenue distribution analysis, the total amount recovered from each of the lighting rate classes. This amount is the target revenue for the detail analysis involved in the lighting cost of service and rate design. The detail analysis entails the development of the cost of service and rate design at the lamp type level. In the street lighting rate class, there are 47 lamp types and in the private area lighting rate class, there are 41 lamp types. Workpaper O.3 presents the lighting cost of service and rate design for both street and private area lighting rate classes.

B. STREET LIGHTING

Q79. PLEASE DESCRIBE THE EXISTING RATE NO. 11 – STREET LIGHTING SERVICE RATE SCHEDULE.

A. The Rate No. 11 – Street Lighting Service Rate schedule is applicable for any village, town, city, state governmental agency, or private division for street lighting purposes only. The rate schedule includes monthly lamp charges (per fixture) for a variety of lamp types, wattages, and service configurations for Company-owned- and Customer-owned Street lighting systems; and a metered installation rate, which consists of a customer charge and an energy charge. The rate schedule includes provisions for applicable riders; special conditions regarding installation and ownership of facilities, operation and maintenance of the system, conversion of certain types of lamps, services and other appurtenances, and termination and balance due to the Company;

as well as terms and conditions that apply to service under this schedule.

Q80. WHAT CHANGES ARE PROPOSED FOR RATE NO. 11 RATES?

A. EPE is proposing to (1) retain the rate structure described above, (2) to update the lamp charges and the metered rate for full recovery of allocated costs, (3) to increase the number of wattage ranges for the LED street lights, and (4) to add maintenance LED rates for existing city-owned LEDs on EPE Company-owned distribution poles. The CCOS shows that the revenues at current Street Lighting rates necessitate a decrease in non-fuel base revenues, as discussed by EPE witness Carrasco. The lamp charges are designed to approximate the target revenue proposed for this rate class in this proceeding. The customer charge of the metered rate is set to collect all the customer-related costs, net of the directly assigned costs (i.e., Account 373) and the energy charge is revised to capture the remaining targeted revenue requirement of this rate class that is not recovery by the customer and lamp charges.

Schedule O-3 provides a comparison of current and proposed rates for Street Lighting Service.

Q81. WHY IS EPE INCREASING THE NUMBER OF WATTAGE RANGES FOR LED STREET LIGHTSIN RATE NO. 11?

A. EPE is increasing the number of wattage ranges for LED streetlights to

accommodate the various and changing types of LEDs being manufactured. As the cost of LED lamps continues to decrease, the Company is finding that it is less expensive to replace older or outdated lamps with LED.

Moreover, as in the past, the Company continues to replace harder to find and discontinued lighting, such as Metal Halide, Mercury Vapor ("MV"), and High-Pressure Sodium ("HPS") bulbs, in favor of LED.

Q82. HOW IS THE COMPANY TRANSITIONING FROM NON-LED LAMPS TO THE NEW LED LAMPS?

A. The Company owns, operates, and maintains all installations billed under Rate No. 11 and continues to expend all non-LED stocked items prior to LED lamps being installed. This is being done based on lamp wattage and availability.

Q83. WHY IS EPE ADDING MAINTENANCE LED RATES FOR EXISTING, CITY-OWNED LEDS ON EPE-OWNED DISTRIBUTION POLES?

A. In Texas EPE services and bills the City of El Paso for maintenance of certain City-owned LED fixtures on EPE-owned poles, as requested, on a case-by-case basis and is establishing formal rates to facilitate an easier billing process, improving operational efficiency.

EPE is proposing to offer this same option in New Mexico. New Lamps are denoted "NEW" on excel column B within the lighting cost of service,

Workpaper O.3.

Q84. OTHER THAN THE BROADLY APPLICABLE LANGUAGE CHANGES, WHAT SIGNIFICANT LANGUAGE CHANGES ARE PROPOSED SPECIFICALLY FOR RATE NO. 11?

A. New language has been added to accommodate some flexibility allowing municipalities, including the City of Las Cruces, the use or addition of new appurtenances, attachments, or technology such as video cameras, sensors, or gunshot detection technology, amongst others. Metered lighting accounts will account for energy use of the addition of new City equipment while non-metered accounts will be updated for costs in future cost allocation studies as applicable in a general rate case.

C. PRIVATE AREA LIGHTING

Q85. PLEASE DESCRIBE THE EXISTING RATE NO. 12 – PRIVATE AREA LIGHTING SERVICE.

A. The Rate No. 12 – Private Area Lighting Service Rate schedule is applicable for any customer desiring overhead nighttime lighting service on Company-owned facilities. The rate schedule includes monthly lamp charges (per fixture) for a variety of lamp types, wattages and service configurations for Company-owned lighting systems. Lamp charges are also offered for installations on facilities other

than Company-owned poles. The rate schedule includes provisions for applicable riders; facilities provided; conversion of certain types of lamps; as well as terms and conditions, including contract terms, that apply to service under this schedule.

Q86. WHAT CHANGES ARE PROPOSED FOR RATE NO. 12 RATES?

A. The Company is not proposing any changes to the existing structure of the Private Area Lighting rates, although it is updating the lamp charges for full recovery of allocated costs, and implementing a new 10-to-30-watt LED lamp charge. The CCOS shows that the revenues at current Private Area Lighting rates necessitate an increase in non-fuel base revenues, as discussed by EPE witness Carrasco. The lamp charges are designed to approximate the target revenue proposed for this rate class in this proceeding.

Schedule O-3 provides a comparison of current and proposed rates for Area Lighting Service.

Q87. WHY HAS THE COMPANY DECIDED TO ADD ANOTHER LED LAMP CHARGE IN RATE NO. 12?

A. As with street lighting, EPE is accommodating the various and changing types of LEDs being manufactured and replacing more costly older, discontinued, or outdated lamps with less expensive LED.

Q88. HOW IS THE COMPANY TRANSITIONING FROM NON-LED LAMPS TO THE NEW LED LAMPS?

A. The Company owns, operates, and maintains all installations billed under Rate No. 12 and continues to expend all non-LED prior to LED lamps being installed. This is being done based on lamp wattage and availability.

Q89. OTHER THAN THE BROADLY APPLICABLE LANGUAGE CHANGES, WHAT SIGNIFICANT LANGUAGE CHANGES ARE PROPOSED SPECIFICALLY FOR RATE NO. 12?

A. As with Street Lighting, the Private Area Lighting tariff will now include new language to accommodate some flexibility, allowing municipalities, including the City of Las Cruces, the use or addition of new appurtenances, attachments, or technology such as video cameras, sensors, or gunshot detection technology. Metered lighting accounts will account for the addition of new City equipment while non-metered accounts will be updated for costs in future cost allocation studies as applicable in a general rate case.

VI. PROPOSED MISCELLANEOUS SERVICE CHARGES

A. OVERVIEW

Q90. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?

A. In this section of my testimony, I present the development of the miscellaneous

charges proposed in this proceeding. I also discuss the more significant revisions to EPE's existing miscellaneous charge rate schedule which are proposed in this proceeding. The more significant changes to this rate schedule are described below and further discussion about changes is provided in Schedule O-4. Additionally, a redlined version of the rate schedule is included as a workpaper to Schedule O4.

Q91. HOW DID EPE DETERMINE IF ANY CHANGES WERE REQUIRED TO ITS CURRENT MISCELLANEOUS SERVICE CHARGES?

A. To determine any potential changes to its approved charges, EPE uses an activity-based costing approach to review the individual charges to determine their continued applicability to customers and their current cost components, to include labor, materials, and overhead. EPE used its supervisory and management staff responsible for a particular activity to review the required time, direct materials, and the number of employees and their job classifications involved in the particular activity including the bargaining unit employees covered under EPE's agreement with International Brotherhood of Electrical Workers ("IBEW") Local Union No. 960 (effective in March 2023). EPE then compared the existing calculations to the new calculations to determine if any change was required. Workpaper WP O.2.1 presents the development of the proposed miscellaneous charges.

B. REVISIONS TO RATE NO. 15

Q92. PLEASE DESCRIBE THE EXISTING RATE NO. 15 – MISCELLANEOUS SERVICE CHARGES SCHEDULE.

A. The Rate No. 15 – Miscellaneous Service Charges schedule is applicable to all customers and lists charges and fees for services performed by EPE that are not at the core of its utility service (i.e., generation/procurement of power, transmission and distribution of the power, metering and billing, administrative support of these functions, etc.).

Q93. IS EPE SEEKING A CHANGE TO ANY OF THE CHARGES FOUND IN ITS CURRENT RATE NO. 15?

A. Yes. EPE's Rate No. 15 currently has thirty-one active service charges applicable to New Mexico jurisdictional customers, including twenty-seven for activities performed within EPE's standard work hours[2] (Standard Rate), two for activities performed outside standard work hours (Non-Standard Rate)[3], and two which are monthly recurring charges. EPE is proposing changes to charges to reflect the current cost of performing these activities.

[2] For the purpose of applying the proposed miscellaneous service charges in Rate No. 15, standard work hours each week are 7:00 a.m. to 8:00 p.m., Monday through Friday, and 7:00 a.m. to 3:30 p.m. on Saturday, except holidays.

[3] The Non-Standard Rate intends to recover the higher cost of an activity caused by the use personnel during call-out or pre-arranged overtime hours. Call-out overtime is paid at double the regular, straight-time rate; while pre-arranged overtime is paid at one and one-half (1-1/2) the regular, straight-time rate. Both call-out and pre-arranged overtime is paid for a minimum of two hours per day.

Q94. WHAT ARE THE CHANGES EPE IS SEEKING TO ITS CURRENT MISCELLANEOUS SERVICE CHARGES?

A. Based on EPE's review of current charges, EPE determined it will propose significant increases (i.e., exceeding 20%) to fourteen (14) of the charges, significant decreases (i.e., exceeding 20 percent) to eight of its miscellaneous service charges, add four new charges, and remove one charge.

Of these charges, four of them are the same charges previously revised as a part of EPE's Compliance Advice Notice 301 pursuant to the Commission's Order Adopting Certification of Stipulation ("Final Order"), issued November 2, 2022, in Case No. 21-00269-UT. Specifically, these four charges were previously reduced, and further reduced here, in evaluation of adjustments that reflects the costs of opt-out and the various miscellaneous fees using the new, system standard metering technologies introduced in the Advanced Meter System ("AMS"). They are the (1) "New Service Start - Field Activity Required (Standard)", (2) the "Non-Pay Reconnect Charge @ Meter (Up to 200 amps or single-phase) (Standard)", the (3) "Non-Pay Reconnect Charge @ Pole (Up to 200 amps or single-phase)", and (4) the "Out of Cycle Meter Reading Charge (Standard)". These Items are on lines 2, 17, 19, and 31 of WP O.2.1 of the Table of Contents tab.

Overall, anticipated rate year revenues reflect a net reduction of approximately $241 thousand in Miscellaneous revenues. Increases in revenue resulting from all individual miscellaneous charge increases, reflect approximately

$38,600, where only six of the fourteen charges experiencing significant increase had any activity in the test year, while total miscellaneous charge decreases amount to $279 thousand, as seen on page 1 of WP O.2.2.

Q95. PLEASE DESCRIBE THE CHANGES TO THE MISCELLANEOUS CHARGES REQUIRING A PROPOSED SIGNIFICANT PERCENTAGE INCREASE.

A. Miscellaneous charges experiencing a significant percentage increase are itemized below.

1. New Service Start - No Field Activity Required charge is proposed to increase $4.75 or (58.33) percent.

2. New Service Start - Field Activity Required (Non-Standard Rate) charge is proposed to increase $22.50 or (40.63) percent.

3. Monthly Fee for Opt-Out Metering Service charge is proposed to increase $10.00 or (48.81) percent.

4. One-Time Fee for Opt-Out Service (Digital Non-Communicating Meter before advanced meter installed) charge is proposed to increase $112.50 or (45.03) percent.

5. One-Time Fee for Opt-Out Service (Digital Non-Communicating Meter after advanced meter installed) charge is proposed to increase $145.50 or (38.31) percent.

6. Energy Diversion Charge is proposed to increase $349.00 or (19.93) percent.

7. Meter Seal Replacement Charge is proposed to increase $14.25 or (29.55) percent.

8. No Access to Equipment Charge - Field Activity Required is proposed to increase $22.00 or (46.67) percent.

9. No Access to Equipment Charge - Enhanced Field Activity Required is proposed to increase $41.00 or (24.24) percent.

10. "No Light" Service Call Charge (Standard Rate) is proposed to increase $36.25 or (20.83) percent.

11. "No Light" Service Call Charge (Non-Standard Rate) is proposed to increase $304.00 or (20.16) percent.

12. Pulse Metering Equipment Repair charge is proposed to increase $92.50 or (20.13) percent.

13. Requested Meter Test Charge (Three Phase) is proposed to increase $179.75 or (20.64) percent; and,

14. Out of Cycle Meter Reading Charge is proposed to increase $23.00 or (64.29) percent.

Q96. PLEASE DESCRIBE THE CHANGES TO THE MISCELLANEOUS CHARGES REQUIRING A PROPOSED SIGNIFICANT PERCENTAGE DECREASE.

A. Due to a combination of improved operational efficiencies and changes related to the implementation of AMS meters, significant reductions are observed for these charges. Each change is itemized below.

1. The New Service Start – Field Activity Required (Standard) charge is proposed to decrease $3.50 or (65.85) percent.

2. The One-Time Fee for Opt-Out Service (Keep Existing Meter) charge is proposed to decrease $26.00 or (36.04) percent.

3. The Non-Pay Reconnect Charge @ Meter (Up to 200 amps or single-phase) (Standard) is proposed to decrease $4.75 or (77.91) percent.

4. The Non-Pay Reconnect Charge @ Meter (Up to 200 amps or single-phase) is proposed to decrease to $22.50 or (35.71) percent.

5. The Non-Pay Reconnect Charge @ Pole (Up to 200 amps or single-phase) is proposed to decrease to $80.50 or (48.73) percent.

6. The Returned Payment Charge is proposed to decrease $10.00 or (52.38) percent.

7. The Special Billing Analysis Charge is proposed to decrease $43.25 or (41.55) percent; and,

8. The Out of Cycle Meter Reading Charge (Standard) is proposed to decrease $3.00 or (65.71) percent.

Details, including the current charges, the proposed charges, the variance

between the two, and the relative percentage change can be seen in WP O.2.1, within the TOC-Charges tab.

Q97. IS EPE PROPOSING TO DELETE ANY MISCELLANEOUS SERVICE CHARGES FROM RATE NO. 15?

A. Yes.

Q98. WHAT RATES IS EPE PROPOSING TO DELETE?

A. In consultation with EPE's operations personnel, it was determined that the cost of reconnections at a pole do not differ based on type of meter installed at a premise. As such, the Non-Pay Reconnect Charge @ Pole (up to 200 amps or single-phase) is being removed as is the language related to amperage and AC power phases for the remaining Non-Pay Reconnect Charge @ Pole. That is, a truck roll is required regardless of the meter type because the initial disconnection and subsequent reconnection occurs at the pole, not at the meter. Thus, the Non-Pay Reconnect at Pole Charge for Standard Metering Service should be equal to Non-Standard Meter Service. This deletion is notated and included in the redline tariff of the Miscellaneous Service Charges, Rate No. 15.

Q99. IS EPE PROPOSING TO ADD ANY MISCELLANEOUS SERVICE CHARGES TO RATE NO. 15?

A. Yes. EPE is proposing to add four new miscellaneous service charges.

Two of the new charges, named "Customer Initiated Lighting Reconnect/Disconnect" and "Customer Initiated Lighting Reconnect/Disconnect Additional Time", are further described below. This includes a proposed new charge for $205.75 based on a two-hour work minimum. The second charge is for any request requiring additional work beyond the minimum and will amount to an additional charge of $139.75.

Additionally, EPE is proposing the addition of two other charges, a Facilities Plus Rental Charge, and a Transmission Facilities Charge, discussed in the testimony of EPE witness Carrasco.

Q100. PLEASE DESCRIBE THE TWO NEW DISCONNECT/RECONNECT SERVICE CHARGES.

A. EPE has experienced an increasing demand for the service of intentional disconnection and subsequent reconnection of private area lighting, often for seasonal holiday displays and other such events. Historically, these occurrences were infrequent and addressed as part of the maintenance function of the lighting department. These requests have grown such that very specific requests with particular time frames now necessitate a change to account for the overhead, coordination, and scheduling involved. This service was recently added to the proposed miscellaneous rates in Texas and is similarly being proposed in New

Mexico for the consistency of electric service offered in both service territories.

Q101. DOES THE REVISION OF MISCELLANEOUS SERVICE CHARGES HAVE ANY OTHER IMPACT?

A. Yes. Changes to Rate No. 15 impact Form 42 - Advance Metering System Opt-Out Acknowledgement Form. Form 42 is updated for impacted pricing, and the second revised form is included as a part of this filing.

C. MISCELLANEOUS CHARGE REVENUE

Q102. ARE THE PROPOSED MISCELLANEOUS SERVICE CHARGES COMPARABLE TO THOSE CHARGED BY OTHER INVESTOR-OWNED UTILITIES OPERATING IN NEW MEXICO?

A. Yes. EPE compared its current miscellaneous service charges, with similar charges currently in effect from those of Public Service Company of New Mexico ("PNM") and Southwestern Public Service Company ("SPS"), as well as EPE's Texas service territory. For the similar charges that exist, EPE found that its proposed charges are generally comparable with two exceptions: (1) EPE's charges involving non-standard rates (after business hours, weekends and holidays) are not comparable, and (2) EPE's requested Energy Diversion charge is higher. Without the determinants and calculations from the utilities surveyed, EPE cannot make a true comparison. However, EPE's charges reflect EPE's attempt to capture all costs

related to the provision of the particular service, especially where EPE participates in the investigation, correction and prosecution of energy theft and the restoration of authorized service for activities that can adversely impact EPE customers and pose a dangerous situation. Exhibit RFG-5 includes this comparison.

Q103. WHAT IS THE EXPECTED CHANGE IN REVENUE FROM MISCELLANEOUS CHARGES AS A RESULT OF THE UPDATED CALCULATIONS?

A. EPE has calculated a reduction in miscellaneous charge revenue of nearly $241 thousand because of the updated calculations, as shown in workpaper WP O.2.2. Most of the reduction is due to operational efficiencies that EPE has implemented, particularly as it relates to AMS. For example, the combination of operational efficiency and self service access provided to customers provides for a reduction in the New Service Start – Field Activity Required charge, thus revenue is reduced by approximately $106 thousand for only this activity. Another example is the Non-Pay Reconnect Charge @ Meter (Up to 200 amps or single-phase) (Standard), where the use of AMS smart meter technology greatly reduces costs and resource allocation. The change in revenue of this activity accounts for an additional $132 thousand in reduced charges to customers.

VII. RULES, REGULATIONS, AND LINE EXTENSION POLICY

Q104. IS EPE SEEKING A CHANGE TO ANY OF THE EPE'S RULES, REGULATIONS, OR LINE EXTENSION POLICY?

A. Yes, EPE is proposing to replace Rule No. 8 – Line Extension, the line extension policy, and Rule No. 13 - Increase or Decrease of Connected Load. Please refer to EPE witness Gallegos for a full detail discussion on the changes to the line extension policy and Rule No. 13.

Q105. PLEASE ELABORATE ON HOW THE PROPOSED DISTRIBUTION CAPACITY RESERVATION CHARGE DISCUSSED BY EPE WITNESS GALLEGOS WILL BE CALCULATED.

A. In his direct testimony, Mr. Gallegos discusses how EPE is experiencing a significant increase in the number of service requests for loads approaching or exceeding 1 MW and, in a few instances, exceeding 10 MW. Mr. Gallegos then describes four scenarios and the proposed solutions to each of those. One of those scenarios is addressed under the changes to several rate schedules above with the addition of a Reserved Distribution Capacity Service Charge. To address large load requests, one of the other scenarios discussed by Mr. Gallegos, is the implementation of a Distribution Capacity Reservation Charge within EPE's line extension policy to help reduce the risk to the Company and its customers of becoming burdened with costs of infrastructure constructed for loads that may not

come online for multiple months or possibly never.

The proposed Distribution Capacity Reservation Charge will be applied to anticipated loads exceeding the installed transformer's capacity, minimum of 750 kVA, and based on the amount of load that a developer requests reservation of capacity for. EPE is proposing using what amounts to twelve months of demand charges under the retail rate applicable to the customer for the requested load to assess this Capacity Reservation Charge. For example, if a developer requests capacity at 2,500 kVA for its facility and the minimum load is 750 kVA in the first twelve months of the facility, then a Distribution Capacity Reservation Charge of $483,280 will be assessed to the developer (see Exhibit RFG-6).

VIII. SUMMARY AND CONCLUSION

Q106. PLEASE SUMMARIZE YOUR TESTIMONY.

A. In my testimony, I described the process by which billing determinants and revenues were adjusted to reflect normal, recurring operating conditions during the base period. This revenue adjustment process resulted in test period, total non-fuel base revenue of $139.9 million for the New Mexico jurisdiction, an increase of $3.3 million from per book base revenue. The difference between this base revenue of $139.9 million and the result of EPE's cost of service analysis, as discussed in the Direct Testimony of EPE witness Hernandez, is the base rate revenue deficiency that is the basis of EPE's requested rate change.

In addition, I discussed EPE's more significant proposals to revise the language of its rate schedules. I presented the lamp lighting cost of service and rate design and the revisions to the related street and private area lighting rate schedules. Finally, I discussed the update to the miscellaneous service charges which result in a decrease in the requested Other Operating Revenue of approximately $241 thousand.

Q107. IN YOUR OPINION, ARE THE BASE REVENUE ADJUSTMENTS AND THE TARIFF LANGUAGE CHANGES DESCRIBED ABOVE FAIR AND REASONABLE?

A. Yes, they are. The proposed adjustments are necessary to restate base period information at a level that reasonably represents sales, customers, demands, and revenues for the rate year. The language changes to EPE's tariffs are proposed to clarify and improve the structure of the rate schedules and better align the language between certain rate schedules applicable in EPE's New Mexico and Texas jurisdictions and to ensure consistency in the criteria applied to the electric service in both service territories. Finally, most generally applicable rate schedules include bill protection clauses to encourage participation in the TOD rate options of those schedules.

Q108. DOES THIS CONCLUDE YOUR TESTIMONY?

A. Yes, it does.

Progress towards Goal

The amended EUEA requires investor-owned electric utilities to achieve no less than five percent reduction of total 2020 retail kilowatt-hour sales over the period of 2021 to 2025. The 2025 target may be reduced by the Commission if a utility cannot achieve the target within the three percent to five percent funding level prescribed by the EUEA. EPE's total retail sales to applicable customer classes was

[8] For some programs, the number of program participants may represent the projected number of homes or businesses participating in a program. For others, the number of participants may represent the number of installed measures or number of completed projects (which consists of various measure mixes and quantities). Please see the program descriptions for details

overall portfolio is presented in the last row of each table. Projected savings per measure are detailed in the individual program sections of this EE/LM Plan.

The loss factor calculation is simply the input required (line 45) divided by the metered sales (line 2).

Table 2 below expands the Table 1 to include a separation of the transmission voltage range to identify a range of 115 kV to 500 kV and a separate 69 kV level for possible use in the Company's studies.

TABLE 2
Loss Factors at Sales (Metered) Level

Voltage Level of Service	w/ GSU* (a)	w/o GSU* (b)	Delivery (c)
Demand (kW)			
Transmission[4] (115 kV)	1.02557	1.02377	N/A
Primary Substation (115 kV)**	1.03147	1.02966	1.00575
Transmission (69 kV)	1.02941	1.02752	N/A
Primary Substation (69 kV)**	1.03533	1.03343	1.00575
Primary	1.06117	1.05931	1.02496
Secondary	1.08208	1.08018	1.01971
Energy (kWh)			
Transmission[4] (115 kV)	1.02565	1.02344	N/A
Primary Substation (115 kV)	1.03248	1.03047	1.00666
Transmission (69 kV)	1.02850	1.02619	N/A
Primary Substation (69 kV)	1.03535	1.03302	1.00666
Primary	1.04670	1.04444	1.01096
Secondary	1.07403	1.07172	1.02611
Losses – Net System Input[5]		6.14% MWh 7.04% MW	
Losses – Net System Output[6]		6.54% MWh 7.58% MW	

**Generation Step Up Transformers*
***Primary Substation Multiplier from Exhibit 8*
MW 1.00575 MWH 1.00666

An overview of the loss study is shown on Figure 1 on the next page. Figure 2 simply illustrates the major components that must be considered in a loss analysis.

[4] Reflects results from Appendix A for 500 kV, 345 kV, and 115 kV.
[5] Net system input equals firm sales plus losses, Company use less non-requirement sales and related losses. See Appendix B, Exhibit 1, for their calculations.
[6] Net system output uses losses divided by output or sales data as a reference.

DECLARATION OF RENE F. GONZALEZ IN SUPPORT OF THE FOREGOING DIRECT TESTIMONY TO THE APPLICATION OF EL PASO ELECTRIC COMPANY FOR REVISION OF ITS RETAIL ELECTRIC RATES PURSUANT TO ADVICE NOTICE NO. 317

I, ***Rene F. Gonzalez***, pursuant to Rule 1-011 NMRA, state as follows:

1. I affirm in writing under penalty of perjury under the laws of the State of New Mexico that the following statements are true and correct.

2. I am over 18 years of age and have personal knowledge of the facts stated herein. I am employed by El Paso Electric Company ("EPE" or "the Company") as the *Supervisor – Rates and Regulatory*.

3. The foregoing Direct Testimony of Rene F. Gonzalez, together with all exhibits sponsored therein and attached thereto, is true and accurate based on my knowledge and belief.

4. I submit this Declaration, based upon my personal knowledge and upon information and belief, in support of EPE's ***Application for Revision of Its Retail Electric Rates Pursuant to Advice Notice No. 317.***

FURTHER, DECLARANT SAYETH NAUGHT.

I declare under penalty of perjury that the foregoing is true and correct.

Executed on March 27, 2026.

EL PASO ELECTRIC COMPANY
DIRECT TESTIMONY OF
MANUEL CARRASCO

I. INTRODUCTION AND QUALIFICATIONS

Q1. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Manuel Carrasco. My business address is 100 N. Stanton Street, El Paso, Texas 79901.

Q2. HOW ARE YOU EMPLOYED?

A. I am employed by El Paso Electric Company ("EPE" or the "Company") as the Manager of Rate Research.

Q3. PLEASE SUMMARIZE YOUR EDUCATIONAL AND PROFESSIONAL QUALIFICATIONS.

A. I hold both a Bachelor's Degree in Accounting and a Master's Degree in Economics from New Mexico State University ("NMSU"). I graduated from NMSU's Accounting program, with honors, in 1995 and from NMSU's Regulatory Economics program in 1999. NMSU's Regulatory Economics program consists of specific courses related to public utilities such as revenue requirements, cost allocation, and pricing in the utility industry. This concentrated graduate program is offered by only a few universities nationwide.

My professional career began in 1993 as a rate analyst with the Utilities Department of the City of Las Cruces, New Mexico, where my responsibilities included performing cost-of-service and rate design studies; preparing fiscal budget

and financial forecasts; and developing forecasts of customers, consumption, and revenues. During my tenure with the City of Las Cruces, I received increasing levels of responsibility, culminating with a promotion to Manager of the Rate & Economic Analysis section. My experience also includes working as an Accountant/Analyst at Sierra Pacific Power Company and as a Senior Pricing Analyst at Colorado Springs Utilities.

I began working for EPE in 2009 as a Rate Analyst Specialist. In 2011, I was promoted to Senior Rate Analyst; in 2015 I was promoted to Supervisor and in 2018, I was promoted to my current position.

In addition to my professional experience and education, I have attended professional development seminars sponsored by National Economic Research Associates (also known as NERA Economic Consulting, Inc.), Electric Utility Consultants Inc., The Brattle Group, NMSU's Center for Public Utilities, American Gas Association, Edison Electric Institute, Association of Edison Illuminating Companies, the Financial Accounting Institute, and American Water Works Association.

Q4. PLEASE DESCRIBE YOUR CURRENT RESPONSIBILITIES WITH EPE.

A. As Manager of Rate Research, my responsibility is to provide oversight of the preparation of economic, statistical, cost and rate design studies; development of models and methodologies for cost-of-service, profitability and pricing studies;

tariff development and administration; and the execution of annualization and revenue forecasts.

Q5. HAVE YOU PREVIOUSLY PRESENTED TESTIMONY BEFORE UTILITY REGULATORY BODIES?

A. Yes, I have previously filed testimony with and testified before the Public Utility Commission of Texas and the New Mexico Public Regulation Commission ("NMPRC" or "Commission").

II. PURPOSE OF TESTIMONY

Q6. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. In my testimony, I present the process EPE undertook to determine the proposed base-rate revenue allocation, as supported by the Class Cost-of-Service ("CCOS") study, including the proposal to phase in the requested base-rate revenue increase to mitigate the bill impact on certain classes. It describes EPE's rate design based on this base-rate revenue allocation for all rate classes (except the two lighting rate classes) and describes the impact of EPE's rate proposals on customers. The testimony also discusses the impact of implementing a mandatory, opt-out time of use rate structure across rate classes that have the capability to shift usage from the system peak period; and I present EPE’s request to implement a Peak Time Rebate Pilot Program. Finally, I support two proposed new large load tariff schedules.

Q7. ARE YOU SPONSORING ANY EXHIBITS IN YOUR TESTIMONY?

A. Yes. I sponsor the exhibits listed in the Table of Contents page and which are attached to this testimony.

Q8. WHAT RULE 530 SCHEDULES DO YOU SPONSOR OR CO-SPONSOR?

A. I am sponsoring or co-sponsoring the following Rule 530 Schedules:

- A-2: Summary of the Revenue Increase or Decrease at the Proposed Rates by Rate Classes;
- O-1: Total revenue requirements by rate classification;
- O-2: Proof of revenue analysis (at proposed rates);
- O-3: Comparison of rates for service under the present and proposed schedules; and
- O-4: Explanation of proposed changes to existing rate schedules.

Q9. WERE THE SCHEDULES AND EXHIBITS YOU ARE SPONSORING PREPARED BY YOU OR UNDER YOUR DIRECT SUPERVISION?

A. Yes, they were.

III. PROPOSED BASE-RATE REVENUE ALLOCATION BY RATE CLASS

Q10. WHAT IS EPE'S TOTAL SYSTEM AVERAGE BASE-RATE REVENUE INCREASE PROPOSED IN THIS CASE?

A. As detailed in the Direct Testimony of EPE witness Adrian Hernandez, and as shown in Schedule A-1, EPE's New Mexico jurisdiction revenue deficiency is $70.4 million. This equates to a proposed total base-rate revenue increase, including non-firm revenues, of $70.6 million[1] or a base-rate revenue increase (i.e., system average increase) of 50.422%.[2] The base-rate revenue increase is slightly more than the revenue deficiency because of a decrease in other operating revenue resulting from EPE's proposed reduction of some of the miscellaneous charges.

Q11. DOES EPE PROPOSE TO MODERATE THE RATE IMPACT OF ITS PROPOSED BASE-RATE REVENUE INCREASE ON CERTAIN RATE CLASSES?

A. Yes. As addressed in the Direct Testimony of EPE witness George Novela, EPE is proposing a moderated movement to full cost-based allocation of the proposed New Mexico jurisdictional revenue requirement to all retail rate classes, consistent with the results of EPE's CCOS study. Under EPE's proposal, interclass subsidization

[1] Through its rate design process, EPE is proposing a non-firm base rate revenue increase at the system average of 50.422% (or $66,848) and the base-rate revenue increase from the rate classes, net of the non-firm base-rate revenue increase, is $70,571,707; summing to a total base rate increase of $70,638,555.
[2] The system average increase is 50.422% ($70,638,555 total base-rate increase / $140,094,381 adjusted total base-rate revenue at existing rates).

would not continue as it has in prior filings. Rather, the Company is proposing to move rate classes to the full recovery of their respective cost of service, thereby eliminating inter-class subsidies to the extent reflected in the CCOS. To achieve this, EPE is proposing to phase in recovery of the proposed $70.6 million base rate increase through a two-part implementation of base rates designed to gradually move certain customer classes to full recovery of their respective cost of service, as explained below. The first phase is likely to take effect on January 1, 2027, and represents a system average increase of 26.8%. The second phase is proposed to take effect on October 1, 2027, and reflects an additional 18.6% increase relative to the rates established in the first phase. This phased-in approach moderates the rate impacts by gradually moving all rate classes to cost-based levels while eliminating inter-class subsidization, rather than implementing the full cost revenue requirement in a single step. Importantly, the proposed October 1, 2027 implementation date for the second phase is intentionally structured to avoid introducing the increased rates during the summer season (June through September), when energy rates are already elevated due to seasonal price differentials, thereby helping mitigate potential customer bill impacts during this high-usage period.

Q12. WHAT IS EPE'S PROPOSED BASE-RATE REVENUE INCREASE BY RATE CLASS?

A. Table MC-1 below summarizes the base-rate revenue allocation by rate class at full cost of service. Because moving certain classes to cost results in an increase that exceeds the 50.4% system average increase, EPE is proposing to split that percentage increase into two phases for those affected classes. For example, the CCOS study indicates that the present revenue requirement for the Residential Service rate class needs to increase 73.1% to achieve full cost recovery.[3] EPE recognizes that a 73.1% increase in base rate revenues in one step would place significant financial and affordability pressures on its residential customers and, therefore, proposes the phasing of that increase in two parts. As indicated in the table (with double asterisks), EPE's proposal is to phase in the revenue increase for the following rates: Rate Nos. 01, 05, 10B, 12, 25, and 26.

[3] See Schedule N-01, at tab Test Year Period.

Table MC- 1 – Full Cost Revenue Requirement by Rate Class
($ in thousands)

Rate No.	Rate Class	Test Period Revenue @ Present Rates	Full Cost Revenue Requirement *	Full Cost % Revenue Increase	Full Cost $ Revenue Increase
01	Residential Service	$73,122	$126,592	73.1%	$53,470**
03	Small General Service	21,053	22,636	7.5%	1,583
04	General Service	20,011	25,662	28.2%	5,651
05	Irrigation Service	3,356	5,268	57.0%	1,912**
07	City & County Service	4,438	6,255	40.9%	1,817
08	Water, Sewage, & Storm Sewage Pumping Service	2,082	2,600	24.9%	519
09	Large Power Service	7,591	9,587	26.3%	1,996
10A	Military Res. & Devel. Power Service – Option A	2,538	3,456	36.2%	919
10B	Military Res. & Devel. Power Service – Option B	1,529	2,750	79.9%	1,221**
11	Street Lighting Service	348	324	-6.8%	(24)
12	Private Area Lighting Service	916	1,457	59.0%	541**
19	Seasonal Agriculture Processing Service	1,115	999	-10.4%	(116)
25	Outdoor Recreational Lighting Service	59	108	81.7%	48**
26	State University Service	1,804	2,839	57.3%	1,034**
Total		**$139,962**	**$210,534**	**50.4%**	**$70,572**

* Net of $67 increase to Non-Firm Revenue from $133 to $199.
** Phasing applied.

The revenue requirement increase of each rate class presented in Table MC-2 below is the targeted increase used for the rate design process of each phase. Continuing with the Residential Service rate class example, the full cost of service revenue requirement of $126,592,000 represents a 73.1% increase over the present revenues of $73,122,000. Because the Company is proposing to implement this increase in

two phases, each phase reflects a 31.6% increase applied sequentially. In Phase 1, the Residential Service revenues increase 31.6% from present rates, resulting in revenues of $96,211,000. In Phase 2, the same 31.6% increase is applied to the Phase 1 revenue level rather than to the present rate revenues. Applying 31.6% to the $96,211,000 produces the full cost of service revenue requirement of $126,592,000. Accordingly, while each phase reflects a 31.6% increase, the second increase is applied to a higher revenue level established in Phase 1. For this reason, the combined effect of the two phases results in an overall increase of 73.1% from present rates to full cost of service for the Residential Service rate class.

19	Seasonal Agriculture Processing Service	(116)	-10.4%	-	0.0%
25	Outdoor Recreational Lighting Service	21	34.8%	28	34.8%
26	State University Service	459	25.4%	575	25.4%
Total		**$37,523**	**26.8%**	**$33,048**	**18.6%**

Exhibit MC-01 shows the mathematical derivation of the final proposed class base-rate revenue allocation (i.e., rate design target revenue) for each phase.

Q13. PLEASE EXPLAIN THE DIFFERENCE BETWEEN THE "FULL COST $ REVENUE INCREASE" IN TABLE MC-1 AND THE "BASE REVENUE

DEFICIENCY" IN TABLE 5 IN EPE WITNESS HERNANDEZ'S DIRECT TESTIMONY.

A. As indicated by the footnote to Table MC-1 above, the full cost of service for each rate class is net of the increase to non-firm revenue allocated to each class. This allocation is done because non-firm revenue, Rate No. 29 – Noticed Interruptible Service Rate For Large Power Service, is not treated as a rate class in EPE's cost-of-service studies, but rather as a revenue credit that is allocated to each firm rate class. This treatment is consistent with EPE's prior rate case filings.

IV. PROPOSED RATE DESIGN

A. OVERVIEW

Q14. WHEN WERE EPE'S CURRENT BASE RATES APPROVED?

A. EPE's current base rates were implemented on January 1, 2024, as per the NMPRC Final Order on Remand in Case No. 20-00104-UT ("2020 Rate Case").[4]

Q15. WHAT ARE THE PRIMARY GOALS EPE SEEKS TO ACHIEVE WITH THE PROPOSED RATE DESIGN PRESENTED IN THIS CASE?

A. EPE seeks to achieve a variety of goals through its proposed rate design. These

[4] On December 7, 2023, El Paso Electric Company ("EPE" or the "Company") filed Advice Notice No. 279 in compliance with the Commission's Final Order on Remand in Case No. 20-00104-UT, issued November 30, 2023.

goals for rate design include the following, in no order of significance:

- Ensuring that demand, energy, and customer costs are recovered in alignment with how these costs are incurred, thereby minimizing intra-class subsidies and providing accurate price signals;
- Ensuring rate structures are supported by cost causation principles and, to the extent possible, encouraging energy conservation and potentially reducing contributions to EPE's system peak demand;
- Providing stable rates for customers; and
- Effectively yielding revenues that allow EPE the opportunity to recover the costs of providing safe and reliable service to New Mexico customers.

Q16. HOW DOES THE COMPANY PROPOSE TO MINIMIZE SUBSIDIES WITHIN EACH RATE CLASS?

A. Subsidies within a rate class occur when the components of the rates charged do not adequately reflect the underlying costs to serve that rate class. EPE proposes to minimize intra-rate class subsidies, to the extent possible, by ensuring that the proposed rates adequately recover each classification component cost in a manner that appropriately reflects their cost causation. Recovering costs based on rate components that reasonably reflect their cost causation results in price efficiency and reduces the potential that some customers within a rate class will subsidize

other customers within the same rate class.

Q17. PLEASE DESCRIBE, IN GENERAL, THESE RATE COMPONENTS.

A. For non-lighting rate classes, the rate components commonly used for the recovery of costs consist of customer charges, energy charges, and demand charges. A *customer charge* is a fixed monthly charge that recovers costs incurred in making service available at the customer's premise such as meter and meter reading costs, billing, record keeping, customer service, and an apportioned share of administration and general costs. *Energy charges* recover costs that vary with the amount of electricity consumed such as fuel, purchased power, variable operation and maintenance costs, and an apportioned share of administration and general costs. For rate classes that are not billed demand charges, the energy charge is designed to recover the costs typically recovered through demand charges. An energy charge is applied on a kilowatt hour ("kWh") basis and increases proportionally with the customer's total energy usage during the billing period. Finally, a *demand charge* is designed to recover capacity-related costs, such as generation, transmission, and distribution infrastructure needed to meet the customer's maximum demand on the system, and an apportioned share of administration and general costs. It is typically applied based on the customer's highest measured average kilowatt ("kW") demand during the billing period or designated peak hours.

Q18. IS EPE PROPOSING RATE STRUCTURES THAT ENCOURAGE ENERGY CONSERVATION AND POTENTIALLY REDUCE CUSTOMERS' CONTRIBUTION TO EPE'S SYSTEM PEAK?

A. Yes. Accurate price signals convey to customers the cost differences between seasonal and non-seasonal time periods. This allows customers to make economic decisions, promotes energy conservation, and encourages customers to shift usage from peak periods to off-peak periods. EPE's proposed demand and energy charges are intended to produce accurate price signals that communicate those price differentials to customers, particularly during summer months. For those rate classes with a time variant pricing structure (*i.e.*, time of use rates), energy charges are developed with on-peak period energy price differentials that have the incentivizing effect of reducing contributions to EPE's system peak.

Q19. DO EPE'S PROPOSED RATES ENHANCE RATE STABILITY FOR CUSTOMERS?

A. Yes. Because EPE's costs of service and cost responsibility by rate class generally do not vary widely from year-to-year, cost-based rates should be similarly stable, avoiding significant rate volatility for customers. Rates that closely follow their underlying cost provide customers with accurate price signals, which allow customers to reasonably anticipate what their electric bills will be and make

economic decisions regarding their electric consumption.

Q20. DO THE PROPOSED RATES PROMOTE STABILITY OF REVENUES FOR EPE?

A. Yes. The proposed rates link revenues more closely to costs, thereby ensuring that the costs are reasonably matched with revenues. That is, by sending customers more accurate price signals, EPE anticipates that revenues will better track future cost increases (or decreases). In addition, EPE's proposed rates attempt to provide a more consistent recovery of fixed costs (*i.e.*, costs that do not vary with the amount of kWh consumed) through more accurate customer and demand charges.

Q21. HOW DO THE PROPOSED RATES PROVIDE EPE WITH AN OPPORTUNITY TO RECOVER ITS COSTS?

A. As demonstrated by Schedule O-2, Proof of Revenues, the proposed rates are designed to fully recover EPE's proposed revenue requirement of each phase. Furthermore, the proposed rates link revenues more closely to costs, resulting in revenues that more accurately track costs year over year.

Q22. HOW HAS EPE INCORPORATED THE RESULTS OF ITS CLASS COST-OF-SERVICE STUDY IN ITS PROPOSED RATES?

A. EPE has proposed rates that are necessary to reflect the costs of providing service,

particularly in determining the individual rate components customer, demand, and energy charges. EPE's proposed charges, contained in its proposed tariffs, were developed to accurately reflect the customer classification component costs, and to the extent possible, the demand, and energy classification component costs calculated for each rate class, as provided in the class cost-of-service schedule, Schedule L, at tab Test Year Period.

Q23. DESCRIBE EPE'S GENERAL PROCESS USED TO DESIGN ITS PROPOSED BASE RATES IN THIS CASE?

A. Theoretically, rates can be developed following any sequence with respect to the different cost elements. EPE chose to start the rate design process with the determination of the customer charge for each rate class. As a general principle, EPE targeted a customer charge that would allow for the recovery of 100% of the customer-related costs for each rate class.

Next, if applicable, EPE proceeded with the design of the demand charges, using EPE's allocated production and transmission costs to recognize seasonal differences. Generally, the summer demand charges are designed to recover production costs categorized in EPE's cost-of-service studies as 4CP or 4CP-A&E. The summer demand charges are also designed to recover a portion of transmission costs that can be considered summer peak related. Also generally, the remaining demand-related costs are recovered equally from the summer and non-summer

demand charges.

Lastly, EPE designed the energy charges for both non-Time of Day ("TOD") and TOD service. In general, like the design of demand charges, energy charges were designed to provide a seasonal pricing signal among rate classes using allocated production and transmission costs, while at the same time using marginal generation cost information to determine the on-peak price adder of the summer TOD rates to approximate the 4CP production costs. The energy charges are the "catch-all" price category that include any costs not recovered through the customer or demand charge rate components, to arrive at the total revenue requirement by rate class as proposed by EPE in this case.

Q24. OVERALL, WHAT IS THE END RESULT OF EPE'S PROPOSED RATES AND RATE STRUCTURES?

A. All of the proposed rates and rate structures mentioned above will provide customers with a pricing structure that reflects the differences and variations in electricity costs throughout the year. EPE's rate structures proposed in this case allow customers to make economic decisions about their electric usage based on rates that reflect the underlying costs and provide economic incentives to conserve energy and potentially improve the utilization of EPE's electric grid, thus increasing the overall system load factor.

Q25. HAS EPE PREPARED COMPARISONS OF CURRENT AND PROPOSED RATES AND IMPACTS ON CUSTOMERS?

A. Yes. Schedule O-03 compares, by rate component, the proposed base rates to current base rates for each rate class and shows the percentage changes to those rates. In addition, I provide Exhibit MC-02, which analyzes the seasonal and annual bill impact of the proposed rates for each rate class and subclass of service with different usage characteristics, including average use within the rate class and/or subclass.[5] The calculations shown in Exhibit MC-02 separately show each typically billed existing and proposed rate component (i.e., customer charge, energy charge, and demand charge) and include other existing applicable rate riders (such as fuel at the monthly average during the base year, AMS surcharges, and energy efficiency and renewable energy charges) to estimate the projected overall bill increase for all customer classes as proposed by EPE in this case.[6]

[5] Subclass refers, for example, to the following subclasses within the General Service rate class: primary voltage; transmission voltage; optional time-of-day secondary voltage; optional time-of-day primary voltage; and optional time-of-day transmission voltage.

[6] Existing applicable riders include Fuel and Purchased Power Cost Adjustment Clause ("FPPCAC") Rate No. 18, the Renewable Portfolio Standard ("RPS") Cost Rider Rate No. 38, the Efficient Use of Energy Recovery Factor ("EUERF") Rate No. 17, Advanced Metering System Rider ("AMS") Rate No. 46, and the Transportation Electrification Plan Cost Rider ("TEP") Rate No. 44. For the calculation of the EUERF, the AMS, and the TEP charges, EPE is applying the approved rates effective as of the filing date of this case. For the calculation of the FPPCAC, EPE is applying the monthly average rates applicable during base period. Franchise fees and taxes are excluded. For the calculation of the RPS Cost Rider component, EPE used the 'illustrative' 2027 Plan Year rate estimate, as filed in Case No. 25-00038-UT, for the bill calculations under current rates and an adjusted 'illustrative' 2027 Plan Year rate estimate, with battery costs removed, for the bill calculations under proposed rates. The battery costs are removed because those are proposed for recovery through base rates in this application, as discussed in the direct testimony of George Novela.

Q26. DO THE SCHEDULES, EXHIBITS, AND WORKPAPERS YOU SPONSOR REFLECT THE PHASING IN OF THE RATE REVENUE INCREASE EPE IS PROPOSING IN THIS RATE CASE?

A. Yes. Schedule O-2, Schedule O-3, Exhibit MC-02, and the supporting rate design workpaper, Workpaper O.1, provide information for each phase that EPE is proposing.

Q27. IN ADDITION TO REVISING THE APPLICABLE BASE RATES, IS EPE PROPOSING ANY OTHER CHANGES TO ITS RETAIL RATE SCHEDULES IN THIS RATE CASE?

A. Yes. EPE is proposing language revisions to multiple rate schedules. Description of the changes is provided in Schedule O-4 and discussed in more detail in the Direct Testimony of EPE witness Rene Gonzalez.

B. CUSTOMER CHARGES

Q28. WHY IS EPE PROPOSING THE FULL RECOVERY OF CUSTOMER-RELATED COSTS THROUGH CUSTOMER CHARGES?

A. As explained above, this proposal is intended to mitigate intra-rate class subsidization and to provide all customers with accurate price signals. If a significant portion of fixed costs that do not vary with the amount of energy or kWh

used (e.g., such as customer-related costs) are recovered through energy charges, then customers with low billed usage, or who reduce their usage (e.g., net-metered customers who have reduced or 'zeroed out' their energy usage), avoid paying the full amount of the fixed costs incurred to provide service to them. Unless fixed costs are recovered through appropriate fixed charges, other customers in the class bear the portion of the fixed costs avoided by customers who install energy efficiency measures, purchase distributed renewable generation or otherwise reduce their energy consumption.

Furthermore, when any customer-related costs not recovered through the customer charge are recovered through energy charges, intra-rate class subsidization occurs because higher-than-average usage customers pay a higher amount toward customer-related costs than the lower-than-average usage customers.

Q29. DOES SETTING CUSTOMER CHARGES AT COST MEAN THAT EPE WILL BE ABLE TO RECOVER ALL OF ITS FIXED COSTS ALLOCATED TO RATE CLASSES?

A. No. Several rates, such as the Residential Service rate, use a two-part tariff consisting of a monthly customer charge and an energy charge. The monthly customer charge recovers the fixed customer-related costs while the energy charge per kWh of electricity recovers all other fixed costs, including generation,

transmission, and distribution system costs.

Q30. IN YOUR OPINION, WILL EPE'S PROPOSED CUSTOMER CHARGES HAVE A LARGE BILL IMPACT ON CUSTOMERS?

A. Not likely. Customer charges typically constitute a small percentage of any rate class's average bills. Also, as discussed in the proposed changes to the Rate No. 01 – Residential Service rate schedule below, low-income customers that are eligible for the low-income rider will not be impacted by any change to the customer charge under that rate schedule.

C. DEMAND CHARGES

Q31. WHAT IS EPE'S RATIONALE FOR THE RECOVERY OF DEMAND-RELATED COSTS THROUGH DEMAND CHARGES?

A. EPE's goal in determining demand charges is to propose charges that align cost causation with cost recovery, that is, demand charges that closely reflect all the underlying demand-related costs, such as those associated with the generation, transmission, substations, primary, and secondary distribution systems. Furthermore, in setting demand charges for some rate classes, the charges by rate class were calculated to balance the stated goal of aligning costs with rates and the potential seasonal bill impacts within each rate class under a three-part tariff (*i.e.*, applying the principle of "rate tilt" in which a portion of demand cost recovery is

shifted from the demand charge into the energy charge).

In some non-residential rate classes, these types of costs are generally recovered through a demand charge applied to the billed kW or maximum load drawn by customers in any given month. Because electric systems are built and sized to meet the electric needs of customers at every point in time, including periods when electricity demand reaches its maximum, demand charges allow utilities to recover these fixed costs through a rate element that more accurately reflects the way these costs are incurred to meet the customer's instantaneous demand. In EPE's rate structures, these demand charges are determined based on the customer's highest level of electric usage during each billing period regardless of when the usage occurs, a demand ratchet based on the customer's load during the summer months, or a minimum demand specified in the rate schedule.

Q32. WHY IS EPE PROPOSING DEMAND CHARGES THAT ARE HIGHER DURING THE SUMMER PERIOD?

A. A higher demand charge during the summer period provides customers with a price signal that recognizes the higher system costs required to meet the loads experienced during the summer months, which is normally the time of the year when continued growth in demand may trigger the need for additional generation capacity. Exhibit MC-03 contains two graphs that can be used to contrast a low load, non-summer day and a peak load, summer day. The peak load, summer day graph shows how

numerous resources are dispatched to meet the peak load, while the low load, non-summer day graph shows that less resources are required to be dispatched. A greater number of resources indicates greater costs, thus the basis for the higher demand charge (and energy charge, for two-part tariffs) during the summer period. The generation units that are shown dispatched in the peak load, summer day detail include Montana Power Station Units 1 through 4, Newman Unit 6, Rio Grande Generating Station Unit 9, and the Copper Generating Station; all of these are categorized as 4CP for allocation purposes in EPE's cost-of-service study. However, Newman Unit 6 is not included in the New Mexico jurisdictional cost-of-service study and therefore is not reflected in New Mexico retail rates. Several of the other generation units are shown as dispatched on that summer peak day, but those units are categorized as 4CP-A&E in EPE's cost-of-service studies. The summer pricing differential, therefore, accounts for the associated costs of all generation units resulting in proposed demand charges that are higher during the summer period.

Also, assessing a higher price during all the summer months could encourage customers to invest in energy efficiency and conservation targeting summer usage and obtain a faster payback on their investment, while helping reduce the peak loads experienced in the summer season.

D. NON-TOD ENERGY CHARGES

Q33. WHAT FUNDAMENTAL APPROACH DID EPE TAKE IN CALCULATING THE NON-TOD ENERGY CHARGES?

A. EPE's approach to calculating the non-TOD energy charges was to ensure that those charges align cost causation with cost recovery, like the demand charges do, and to provide a strong pricing signal toward conservation during the summer months. Another potential consequence of this stronger pricing signal is to reduce the loads that have contributed to EPE's declining load factor. EPE witness Enedina Soto addresses the declining load factor in her direct testimony.

Q34. DO EPE'S CURRENT NON-TOD ENERGY CHARGE STRUCTURES ALREADY PROVIDE THIS CONSERVATION PRICING SIGNAL?

A. Yes, they do. All non-TOD energy charges in the Company's non-lighting rate schedules exhibit seasonal pricing, in which the summer energy charge is higher than the non-summer energy charge. A more extreme example is the inclining two-tier rate structure of the Residential Service rate schedule, in which the summer energy charge for usage falling within the second tier is greater than the energy charge for usage in the first tier.

E. SEASONAL ANALYSIS BETWEEN STANDARD SERVICE AND ALTERNATIVE TOD SERVICE RATES

Q35. DID EPE CONDUCT A STUDY OF SEASONAL CHARGES AS DIRECTED BY THE COMMISSION IN ITS ORDER IN CASE NO. 20-00104-UT?

A. Yes. In the *Order Adopting Recommended Decision with Modifications* issued in Case No. 20-00104-UT, the Commission instructed EPE in paragraph 52 to provide in its next rate case "a study of the impacts of seasonal charges upon both TOD rate structures and standard rate structures." The Commission further directed that the "study must include an analysis as to whether raising the Winter seasonal charge to the level of the Summer seasonal charge could fund a more effective TOD rate structure, possibly including lower on-peak rates." In this filing, EPE has included that analysis as Exhibit MC-04.

Q36. WHAT DID EPE'S ANALYSIS SHOW?
