A. The impact of seasonal charges upon both TOD rate structures and standard rate structures, as emphasized extensively in this testimony, is that the seasonal pricing differentials reflect cost causation and send signals to customers that indicate the high cost of capacity requirements driven by summer peak loads and the ample capacity available during the other months. Exhibit MC-04, at tab Seasonal Cost, shows the costs to meet summer peak loads amount to $69.1 million and represent about 43% of the demand-related costs allocated to the New Mexico jurisdiction

that should be recovered over the four-month summer period. On a jurisdictional basis, the ratio of monthly summer peak costs to monthly non-peak related costs is 2.23 to 1, indicating that prices in the summer should be much higher than non-summer prices in proportion to this cost differential. The seasonal price differential, whether in the form of demand charges or energy charges or combination thereof, should provide for 100% recovery of those summer peak load costs. For rate design at the rate class level, the load that each rate class places on the system during the summer is taken into account in the determination of the seasonal price differentials for that rate class.

EPE's analysis also determined that raising the Winter ("non-summer") seasonal charge to the level of the summer seasonal charge would shift recovery of peak-driven capacity and production costs into a season that does not drive those costs, as EPE's system peaks during the summer months. Maintaining higher summer charges than non-summer charges ensures that rates continue to align with system costs and customer usage patterns. As shown in Exhibit MC-04, tab Rates, which focuses on the Residential Service rate class, shifting summer peak-related costs into the non-summer season would distort price signals, create bill impacts inconsistent with system costs, and would not enhance the effectiveness of the TOD rate structure. For example, the proposed Phase 1 rates show a Summer on-peak charge of $0.25799/kWh compared to an off-peak charge of $0.08915/kWh, producing an on-peak to off-peak ratio of 2.89 to 1. This ratio appropriately signals

the cost of consumption during peak periods when system demand is highest. By contrast, the hypothetical scenario shown in the exhibit, where non-summer charges are increased to match summer levels, materially weakens this price signal. In Phase 1, the on-peak to off-peak ratio falls from 2.89 to 1 under the proposed design to 1.71 to 1 under the hypothetical design, and in Phase 2 a ratio of 2.36 to 1 declines to a ratio of 0.99 to 1. A ratio approaching or below parity reduces the incentive for customers to shift usage away from peak hours and undermines the core objectives of a TOD rate structure, which is to encourage usage patterns that align with system cost drivers. In addition, the exhibit demonstrates that the hypothetical approach would redistribute bill impacts between seasons in a way that is inconsistent with cost-causation. While the annual average bill remains nearly unchanged, the seasonal impacts shift significantly. For example, under Phase 1 the hypothetical design would reduce the average summer TOD bill by approximately $19.76, while increasing the non-summer average bill by $9.87. Similar patterns occur in Phase 2, where the summer bill decreases by $31.77 and the non-summer bill increases by $15.86. This seasonal reallocation would move recovery of peak-driven costs away from the period when the costs actually occur. For these reasons, EPE is proposing to maintain the seasonal differentiation reflected in its current and proposed rates and preserve a TOD rate structure that accurately reflects system cost drivers and encourages efficient customer usage patterns.

F. TOD ON-PEAK PERIOD HOURS

Q37. IS EPE PROPOSING TO CHANGE THE ON-PEAK PERIOD HOURS FOR TOD RATES?

A. No. EPE is proposing to maintain the on-peak period hours of its existing TOD rates, which are from 3:00 p.m. to 7:00 p.m., Monday through Friday, in the months of June through September.

Q38. WHAT ANALYSIS DID EPE PERFORM TO SUPPORT MAINTAINING THE CURRENT ON-PEAK PERIOD HOURS?

A. EPE reviewed the hours of highest daily demand for the past five years (2021–2025) using native system load data during the 60 highest-load days of each year. The analysis shows that peak demand most frequently occurs between 3:00 p.m. and 6:00 p.m. MDT, with occasional peaks extending to 7:00 p.m. These results demonstrate that the existing on-peak period accurately aligns with EPE's system demand profile.

Table MC-3 below shows that between 2021 and 2025, the frequency with which the hour of highest daily demand occurred between 5:00 p.m. and 6:00 p.m. increased from 26.67% to 70%, demonstrating a continued concentration of system peaks in the later portion of the existing on-peak window.

Table MC-3 Hour of Highest Daily Demand

	2:00:01PM to 3:00:00PM	3:00:01PM to 4:00:00PM	4:00:01PM to 5:00:00PM	5:00:01PM to 6:00:00PM	6:00:01PM to 7:00:00PM
2021	0.00%	10.00%	63.33%	26.67%	0.00%
2022	0.00%	21.67%	53.33%	25.00%	0.00%
2023	0.00%	6.67%	31.67%	61.67%	0.00%
2024	0.00%	10.00%	35.00%	53.33%	1.67%
2025	0.00%	6.67%	21.67%	70.00%	1.67%
Times are in MDT					

Q39. IS MAINTAINING THE EXISTING ON-PEAK PERIOD CONSISTENT WITH THE COMMISSION FINAL ORDER IN EPE'S MOST RECENT RATE CASE AND DOES IT CONTINUE TO BENEFIT CUSTOMERS?

A. Yes. Maintaining the current on-peak hours is beneficial because it is consistent with the principles that the Hearing Examiner relied on in the Recommended Decision ("RD") in Case No. 20-00104-UT when the Commission adopted the current four-hour peak window. In that case, the RD rejected EPE's proposed gradual approach of a six-hour on-peak period and found that a shorter, four-hour on-peak period best supported a meaningful customer response. The RD found that customers are more likely to participate in and shift usage under a shorter on-peak period, and that extending the peak period creates a "hassle factor" that reduces the

effectiveness of the price signal. The RD also highlighted that during that proceeding, EPE agreed that a shorter on-peak period makes it easier for customers to modify their usage.[7] Those same findings remain true today. As shown in Table MC-3 above, EPE's system peaks continue to occur during the current on-peak period hours. Redefining the period absent a material shift would dilute the price signal that customers have adapted to.

G. TOD ENERGY CHARGES

Q40. HOW WERE THE PROPOSED ON-PEAK PERIOD AND OFF-PEAK PERIOD ENERGY CHARGES CALCULATED?

A. As discussed, a key element of the design of TOD rates is the calculation of the off-peak and on-peak energy charges. The on-peak energy charge should be set to signal to the customer the potential additional cost EPE could incur to provide additional service during the peak hours of the peak period. It is the demand during these hours that drives EPE's investment decisions for securing additional resources to serve peak load, and a goal of setting the TOD prices is to signal to the customer the cost consequences of consumption during these hours because of its contribution to peak load. To capture that additional cost, EPE's rate design includes an on-peak adder during the peak hours to reflect the marginal cost of

[7] See pages 244 – 250 in the Recommended Decision in Case No. 20-00104-UT filed on April 6, 2021.

generation or in other words what the cost would be of additional generation to serve during those hours. The on-peak period energy price adder, which is the incremental charge for consumption during the on-peak period hours, was set based on a percentage of EPE's marginal generation cost of $91.79 per kW-year. This amount was divided by the average consumption for the rate class during the proposed on-peak period hours to derive the on-peak period energy price adder per kWh. The on-peak period energy price adder is added to the Off-Peak Period Energy Charge to produce the On-Peak Period Energy Charge. The percentage of total marginal generation cost to recover in the on-peak period differs by rate class. The Off-Peak Period Energy charge per kWh was calculated to recover the remaining cost that is not recovered through the Customer, Demand, Non-Summer Energy, and On-Peak Period Energy Charges and is applicable during all other hours of the year.

Q41. HOW DID EPE DETERMINE THE MARGINAL GENERATION COST OF $91.79 PER KW-YEAR?

A. In EPE's last rate cases in New Mexico and Texas, EPE relied on the costs for the Rio Grande Unit 9 combustion turbine to estimate the marginal generation cost used in rate design. However, in this case, EPE relied on the costs for the Newman Unit 6 combustion turbine to estimate the marginal generation cost used in rate design. This is consistent with the electric utility industry where the cost of a

combustion turbine has been used as a proxy for the marginal generation costs. Development of the marginal generation cost is shown in the rate design workpaper, Workpaper O.1 at tab NM6 Incremental Cost Calc.

Q42. WHY DID EPE USE NEWMAN UNIT 6 INSTEAD OF RIO GRANDE UNIT 9 FOR THE MARGINAL GENERATION COST CALCULATION FOR THIS RATE CASE?

A. EPE determined that Newman Unit 6, although not included in New Mexico rates, provides the most current basis for estimating marginal generation costs. This unit entered service in late 2023, reflects updated investment and financing costs, and represents EPE's most recent conventional gas generation resource addition. Because it incorporates the most recent cost environment, EPE believes that it serves as a more accurate guide for marginal generation cost than using Rio Grande Unit 9, which reflects an older cost structure.

Q43. HAVE STAKEHOLDERS PREVIOUSLY RECOMMENDED USING MORE RECENT GENERATING UNITS TO DEVELOP THE MARGINAL GENERATION COST?

A. In EPE's most recent New Mexico rate case (Case No. 20-00104-UT), certain stakeholders recommended that EPE use costs from a more recent generating unit when developing marginal generation costs. In that case, the City of Las Cruces

suggested using EPE's more recent units, at the time, Montana Power Station Units 3 and 4 for this.[8] Therefore, EPE's reliance on Newman Unit 6 in this case is consistent with those prior recommendations and provides a more current estimate of marginal generation costs.

Q44. PLEASE EXPLAIN WHY THE ON-PEAK PERIOD ENERGY PRICE ADDER IS BASED ON PERCENTAGES OF THE MARGINAL GENERATION COST THAT DIFFER BY RATE CLASS.

A. The percentages differ by rate class because each class has a different allocation of production capacity costs based on its contribution to system peak demand, as reflected in the 4CP allocator used in EPE's cost of service studies. In all TOD rate options, the percentages are adjusted so that the revenue associated with the adder is no more than approximately 100% of the allocated 4CP production cost for the rate class. Because the level of allocated capacity costs varies by class, the percentage applied to marginal generation cost must also vary to ensure proper recovery. The resulting on-peak energy price adders by rate class, along with the corresponding percentages, are shown in EPE's rate design model, Workpaper O.1.

[8] Direct Testimony of Jose F. Provencio at 40:9-17 in Case No. 20-00104-UT.

Q45. WHAT IS EPE'S APPROACH TO CALCULATING THE OPTIONAL TOD RATE OPTIONS?

A. The optional TOD rate options were designed to be revenue neutral relative to the annual charges under the standard service rate. This approach will result in the annual rate class base-rate revenue being the similar amount whether all customers in the rate class choose to take service under the standard rate or under the TOD rate, assuming usage patterns do not change.[9] Revenue neutrality results from comparing the total "annual" base-rate revenue allocated to the rate class, either for the standard or the optional TOD rate designs. More importantly, the revenue neutrality between the standard and optional TOD rates applies to the "average" annual bill and not to each month or season.

Q46. IN ITS ORDER DENYING EPE'S PETITION FOR VARIANCE, THE COMMISSION ORDERED EPE TO INCLUDE A PROPOSAL FOR AN OPT-OUT TOD RATE DESIGN IN ITS NEXT BASE RATE CASE. HAS EPE INCLUDED SUCH PROPOSAL IN THIS PROCEEDING?[10]

A. Yes, and it primarily entails the labeling of the TOD rate option as the default rate structure in certain rate schedules. As discussed by EPE witness Novela, however,

[9] Although the approach is to make the revenues "neutral" between standard service and alternative service rate options, due to rounding, the amounts will not necessarily be equal.
[10] *Order Denying Petition for Variance*, Docket No. 20-00104-UT, issued August 31, 2022.

EPE does not recommend adopting an opt-out TOD rate design at this time because it recently implemented its Time Varying Rate Pilot Program which will help inform the creation of a successful company-wide time-varying rate design.

If the Commission would order mandatory, opt-out TOD rates in this proceeding, the *opt-out* TOD rate design is not different from the *opt-in* TOD rate design that is described in my testimony. In other words, an opt-out TOD rate design is the same as the opt-in TOD rate design that EPE is proposing in this rate case. To comply with an order for mandatory opt-out TOD rate, EPE would submit replacement rate schedules for those submitted in the advice notice filed in this proceeding that would indicate that the TOD rate structure is the 'standard' rate and the non-TOD rate structure is the optional rate. For example, the Rate No. 01 inclining-tier rate structure, currently shown as the Standard Service Rate, would become the optional rate and the rate structure currently shown as the Time Of Day (TOD) Rate will become the standard rate. Additionally, the hold harmless provision would be replaced with language to inform that customers can opt-out of the TOD Rate if service under it is causing an unduly burdensome increase in electricity costs (e.g., bills have quadrupled because the customer is unable to modify consumption during on-peak hours).

Q47. IF THE COMMISSION ORDERS THE IMPLEMENTATION OF MANDATORY, OPT-OUT TOD RATES, HOW DOES EPE PROPOSE TO

ADDRESS POTENTIAL SHORTFALLS IN REVENUE RECOVERY?

A. While EPE does not support implementation of mandatory, opt-out TOD rates at this juncture, the Company recognizes that the increased customer participation in a mandatory, opt-out TOD rate may result in changes in usage patterns leading to bill savings for customers and reduced revenues for EPE due to load shifting from on-peak to off-peak hours. To the extent these shifts exceed the level reflected in the Test Year Period data, they may create a shortfall in the recovery of the Commission-approved revenue requirement. To address this potential outcome, EPE is requesting authorization to establish an accounting order to record any such shortfall. This accounting order would allow the Company to track and defer for future recovery the difference between the revenues approved in this case and the actual revenues collected, to the extent the difference is attributable to changes in customer usage patterns under the new mandatory, opt-out TOD rates. This approach helps ensure revenue neutrality, while maintaining the Commission's objective of encouraging greater customer participation in TOD rates.

Q48. WHY IS AN ACCOUNTING ORDER THE APPROPRIATE MECHANISM TO ADDRESS THIS POTENTIAL REVENUE SHORTFALL?

A. An accounting order to track a regulatory asset is the appropriate mechanism currently because it provides a transparent and Commission-approved method to track and defer any revenue shortfall that results from customer load shifting under

the potential new mandatory, opt-out TOD rates. Establishing an accounting order ensures that EPE has an orderly means of identifying and quantifying the revenue impact attributable to this structural change, while preserving the Commission's ability to review and determine the appropriate recovery in a future proceeding. This approach balances the objectives of encouraging customer participation in TOD rates and maintaining the integrity of the Commission-approved revenue requirement, without introducing immediate volatility in customer bills or the Company's financial condition.

Q49. HAS EPE ESTIMATED THE POTENTIAL SHORTFALL?

A. Yes. EPE has developed two illustrative scenarios to demonstrate the potential revenue impact of customer load shifting under the mandatory, opt-out TOD rates. Exhibit MC-05 presents these calculations.

- 10% shift scenario: If 10% of on-peak usage migrates to off-peak hours, EPE estimates an annual revenue shortfall of approximately $1.8 million.
- 20% shift scenario: If 20% of on-peak usage migrates to off-peak hours, EPE estimates an annual revenue shortfall of approximately $3.7 million.

Both scenarios are illustrative rather than predictive because currently EPE cannot predict with any accuracy how customers will actually respond to mandatory TOD rates. Consequently, the scenarios are intended to show the potential range of

revenue impacts. They underscore the need for an accounting order to track a regulatory asset to transparently capture and track any differences between approved revenues and actual collections under mandatory, opt-out TOD rates.

Q50. PLEASE EXPLAIN HOW CUSTOMERS WILL BE PROTECTED IF THE COMMISSION AUTHORIZES AN ACCOUNTING ORDER TO TRACK A REGULATORY ASSET FOR THIS PURPOSE.

A. EPE's customers are protected because the establishment of an accounting order to track a regulatory asset does not guarantee automatic recovery of any deferred amounts. Instead, it simply records the difference between the approved revenue requirement and actual revenues collected, to the extent that difference is determined to be attributable to customer load shifting under the mandatory, opt-out TOD rates. The Commission will retain full authority to review the prudence, accuracy, and reasonableness of any deferred balance in a future base rate case proceeding before approving recovery of the amounts in the regulatory asset. This method ensures transparency and accountability, while providing EPE with the necessary accounting treatment to maintain revenue neutrality under the new rate structure.

V. PROPOSED RATE DESIGN BY RATE CLASS

Q51. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?

A. In this section of my testimony, I discuss the specific rate design that EPE is proposing in this proceeding for each rate class. Schedule O-3 provides a comparison of current and proposed rate components for each of the rate options of all the proposed rate schedules. Discussion about the rate changes to each rate schedule is also provided in Schedule O-4. Also, as discussed in Section III above, the rate increase to several rate classes is proposed to be phased in (i.e., Rate Nos. 01, 05, 10B, 12, 25, and 26). In the discussion below of each of these rates, values associated with (Phase 1) represent the interim rates that will remain in effect until the Phase 2 rates take effect.

A. Rate No. 01 – Residential Service

Q52. PLEASE DESCRIBE THE EXISTING STRUCTURE OF RATES OFFERED UNDER RATE NO. 01.

A. This rate schedule includes two monthly rate options: a Standard Service Rate and an opt-in TOD Rate. The Standard Service Rate structure consists of a monthly Customer Charge and a seasonally differentiated Energy Charge. The non-summer Energy Charge, applicable from October through May, is a flat charge per kWh. The summer Energy Charge, applicable from June through September, is an inclining two-tiered rate structure. The first tier consists of billed consumption up to 600 kWh. The second tier includes all billed consumption that exceeds 600 kWh.

The TOD Rate consists of a monthly Customer Charge and a seasonally

differentiated Energy Charge that applies based on the month, day, and hour that usage occurs. The On-Peak Period Energy Charge applies from 3:00 P.M to 7:00 P.M. Mountain Daylight Time (in all rate schedules, all times listed are Mountain Daylight Time, "MDT"), Monday through Friday during the summer period, and the seasonally differentiated Off-Peak Period Energy Charge applies during all other hours. Like EPE's other TOD rates, the summer period is defined as June through September.

Q53. WHAT CHANGES DOES EPE PROPOSE FOR THE RATE NO. 01 RATES AND RATE STRUCTURES?

A. For the Standard Service Rate, EPE is proposing to:

(1) set the monthly Customer Charge to collect all the customer-related costs;

(2) set the price differential between the first tier of the summer and non-summer Energy Charges to allow recovery of 50% of the sum of the 4CP and the excess related, 4CP-A&E categorized production and transmission costs; and

(3) set the price differential between the first and second tiers of the summer Energy Charges to recover (100% Phase 1) 80% of the 4CP categorized production costs.

For the TOD Rate, EPE is proposing to:

(1) set the monthly Customer Charge equal to the Standard Service Rate Monthly Customer Charge;

(2) set the non-summer Off-Peak Energy Charge equal to the Standard Service Rate non-summer Energy Charge; and

(3) adjust the on-peak adder component of the On-Peak Energy Charge to recover 100% of the 4CP categorized production costs.

Q54. WHY IS EPE PROPOSING TO INCREASE THE CUSTOMER CHARGE FOR THE RESIDENTIAL SERVICE RATE?

A. As noted previously, rates that reflect the cost of providing service communicate accurate price signals to customers. Therefore, EPE is proposing to increase the monthly Customer Charge for Residential Service from $7.00 to ($14.36 Phase 1) $18.89 to reflect the customer-related costs determined by its cost-of-service study accurately. Exhibit MC-01, at tab NM L-1 Full COS, shows that the customer-related costs for the Residential Service rate class, based on the cost-of-service study, amount to $17.874 per month. The difference between the proposed Phase 2 monthly Customer Charge and the cost-of-service study unit cost is, as will be explained later, to provide for the recovery of the low-income rider discount. Without an increase to the Customer Charge, EPE will recover only 39.2% of the customer-related costs through the customer charge; and even less once the low-income rider discount is applied.

Q55. WHEN WAS THE CUSTOMER CHARGE FOR THE RESIDENTIAL SERVICE RATE LAST INCREASED?

A. The residential customer charge was last increased in Case No. 09-00171-UT ("2009 rate case"). In the 2009 rate case, EPE proposed to increase the residential customer charge from $6.00 to $10.00. However, the parties ultimately stipulated to a $7.00 customer charge. Since that time, the residential customer charge has not changed.

In Case No. 15-00127-UT, EPE proposed to increase the customer charge from $7.00 to $10.00. While the Recommended Decision in that case recommended an increase to $9.00, the Final Order approved maintaining the customer charge at $7.00. Similarly, in the 2020 rate case, EPE proposed increasing the customer charge from $7.00 to $10.88, but both the Recommended Decision and Final Order ordered retaining the existing $7.00 customer charge.

Accordingly, the residential customer charge in New Mexico has remained unchanged at $7.00 for approximately 17 years.

Q56. HOW DOES EPE'S CURRENT CUSTOMER CHARGE FOR RATE NO. 01 COMPARE TO OTHER INVESTOR-OWNED UTILITIES IN NEW MEXICO?

A. EPE’s current residential Customer Charge of $7.00 per month is the lowest among the other investor-owned electric utilities in New Mexico. Namely, Southwestern Public Service Company’s ("SPS") currently approved residential customer charge

is $11.20[11] and Public Service Company of New Mexico's ("PNM") customer charge is $10.94[12], and was approved to increase further to $11.93 in the second phase of PNM's most recent rate adjustment.[13]

Q57. WHY IS EPE PROPOSING TO SET THE PRICE DIFFERENTIAL BETWEEN THE SUMMER AND NON-SUMMER ENERGY CHARGES SO THAT THE HIGHER SUMMER ENERGY CHARGE RECOVERS ONLY 50% AND NOT 100% OF THE SUMMER PEAK-RELATED COSTS?

A. As noted previously, EPE is proposing rate structures that send pricing signals that communicate the higher production and transmission-related costs incurred by EPE to meet the summer months' loads. EPE proposes a price differential between the first tier of the Standard Service Rate Summer Energy Charge and the non-summer Energy Charge of (2.4 Phase 1) 3.3 cents to provide a stronger price signal for the four-month summer season than the current 1.2 cent differential, which appears to provide only a weak signal. Even at that proposed price differential, the incremental revenue will recover only half the costs that EPE has identified as

[11] SPS's Rate No. 1 – Residential Service, effective October 19, 2023. Accessed on August 19, 2025, at https://www.xcelenergy.com/staticfiles/xe-responsive/Company/Rates%20&%20Regulations/Rate%201,%20Rev.%2016%20-%20Residential%20Service%20(Oct%2019,%202023).pdf.
[12] PNM's Rate No. 1A Residential Service, effective July 1, 2025. Accessed on August 19, 2025, at https://www.pnm.com/documents/d/pnm.com/26th-revised-rate-no1a-residential-service.
[13] PNM's residential service customer charge will increase to $11.93 beginning on April 1, 2026, pursuant to the Final Order in Case No. 24-00089-UT.

summer peak related costs for this rate class. While EPE recognizes that the cost differential associated with serving summer peak load is higher, the Company limited the proposed differential to balance improved cost-based pricing signals with the need to mitigate potential rate impact that could result from fully reflecting the seasonal cost differential in a single rate adjustment. Seasonal energy charges also encourage energy conservation and may reduce customers' contribution to EPE's system peak.

Q58. WHY IS EPE PROPOSING TO INCREASE THE PRICE DIFFERENTIAL BETWEEN THE FIRST AND SECOND TIERS OF THE STANDARD SERVICE SUMMER ENERGY CHARGES?

A. Like the purpose of seasonal Energy Charges, the intent of an inclining-tier structure is to send pricing signals that communicate EPE's on-peak production-related costs and to encourage energy conservation and potentially reduce customers' contribution to EPE's system peak. EPE proposes to increase the price differential between the first and second tiers of the Standard Service Rate Summer Energy Charge from the current differential of slightly less than four cents to a differential of approximately five cents to more fully recover the 4CP categorized production costs.

Q59. HAS THE COMPANY ADJUSTED BILLING DETERMINANTS FOR ENERGY CONSERVATION AND POTENTIAL REDUCTION IN THE CUSTOMERS' CONTRIBUTION TO EPE'S SYSTEM PEAK AS A RESULT OF THE INCREASED PRICE DIFFERENTIALS?

A. No. Although the increase in the price differentials is expected to result in customers modifying their consumption behavior, price elasticity data specific to EPE (which would demonstrate how much consumption would fall in response to a certain percentage increase in price) is not available to make any reasonable estimation of an adjustment to billing determinants of this or any rate class or rate option.

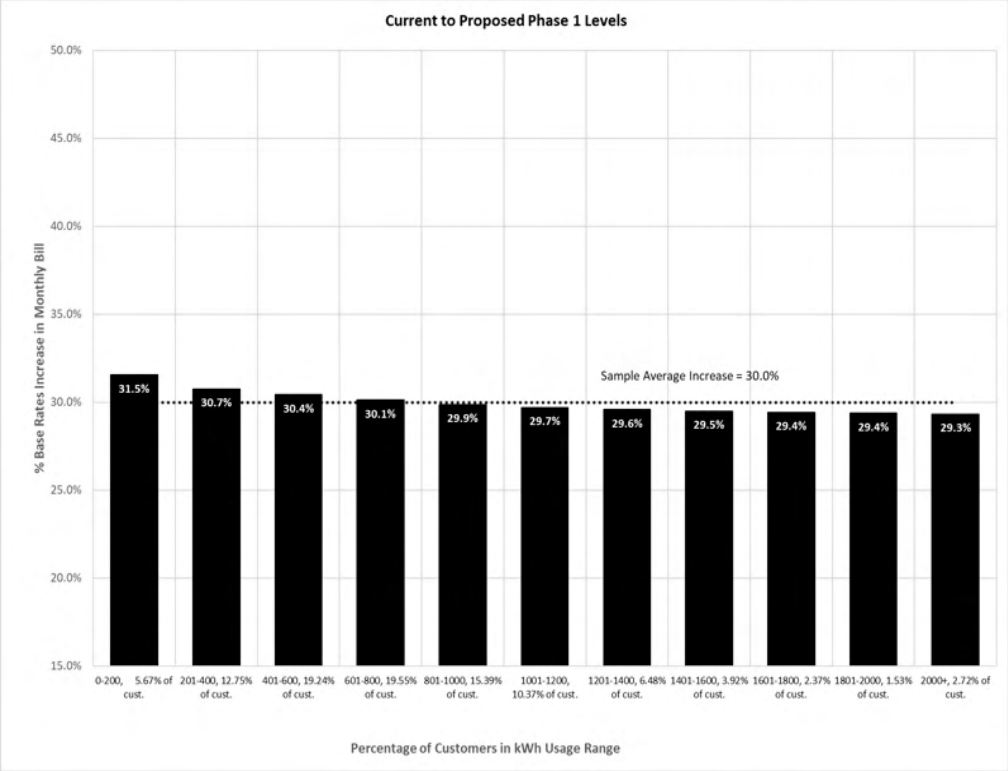
Q60. HAS THE COMPANY ANALYZED THE IMPACT OF THE PROPOSED STANDARD SERVICE RATES ON RESIDENTIAL SERVICE CUSTOMERS WITH VARIOUS USAGE CHARACTERISTICS?

A. Yes. Exhibit MC-02 provides seasonal and annual bill impacts based on various levels of electric usage. Figure MC-1 below shows a frequency distribution of the Phase 1 bill impacts, in percent bill increase (base rates only), based on the levels of electric usage for the Base Period, and assuming the proposed changes to the Standard Residential Service Rate.[14] The figure shows the expected distribution of

[14] The frequency distribution is based on the sample of Rate 01 customers that had consumption that was not below zero kWh in all twelve months during the Base Period.

potential bill impacts across various levels of electric usage for Residential Standard Rate customers.

Figure MC-1 Distribution of Bill Impact for Residential Customers

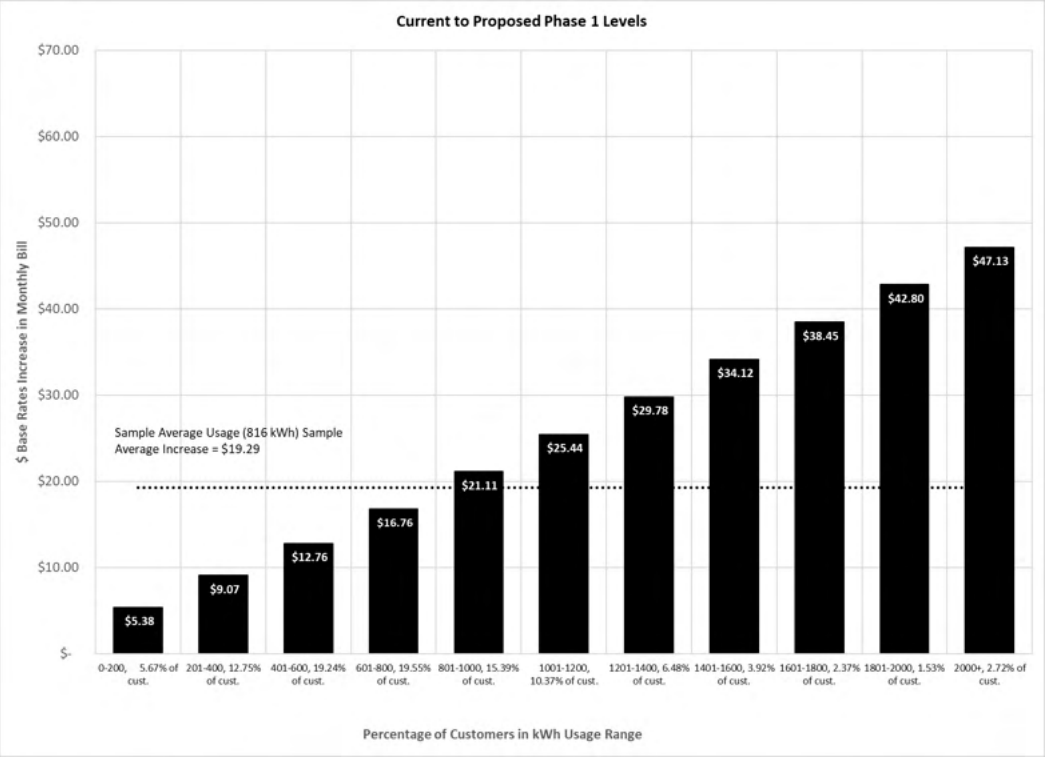


As shown in Figure MC-1, about 43% of customers can expect to experience percentage increases that are at or below the sample average. Customers with lower levels of electricity usage tend to experience somewhat higher percentage impacts because the proposed change includes an increase of approximately $7.00 in the monthly customer charge, in Phase 1, which represents

a larger share of the total bill for lower-usage customers. Accordingly, approximately six percent of customers, primarily those in the lowest usage range, are expected to experience percentage increases above roughly 31.5 percent, while most of the customers can expect experience impacts below the 30.0% average increase (indicated by the horizontal dotted line). Similar graphs for Phase 2 and at implementation at full rates are provided in Exhibit MC-06.

To provide further context on the bill impacts to residential customers, Figure MC-2 below provides the dollar base charge increase in the monthly bill.

Figure MC-2 Distribution of $ Bill Impact for Residential Customers



The data in Figure MC-2 shows that lower usage customers will experience the least amount of dollar amount increase as compared to the higher usage customers. For example, those in the lowest usage range – which make up approximately six percent of customers – are expected to experience about a $5.38 increase in the base rate components of their bill, as compared to the average $19.29 increase (which is indicated by the horizontal dotted line in the graph).

Q61. WHAT IS THE IMPACT OF THIS RATE STRUCTURE ON PROPOSED LOW INCOME RIDER CUSTOMERS?

A. EPE is proposing to introduce a Low-Income Rider in New Mexico that provides a credit equal to the monthly Customer Charge for qualifying customers. As proposed, New Mexico customers who qualify for this rider would receive the same monthly credit, dollar for dollar, of the monthly Customer Charge. Therefore, the impact of the higher Customer Charge to qualifying customers under the proposed rate structure would be offset by the discount provided through this rider. Please see the Direct Testimony of Rene Gonzalez for further explanation of the proposed rider.

Q62. HOW MUCH DOES EPE EXPECT THE DISCOUNT PROVIDED BY THE LOW-INCOME RIDER TO AMOUNT TO ANNUALLY?

A. EPE estimates that the total annual discount provided through the proposed Low-Income Rider to the 5,329 customers that EPE identified as current Low Income Home Energy Assistance Program benefit recipients in New Mexico will be approximately ($918 thousand Phase 1) $1.2 million. Note that the number of eligible customers may be larger than 5,329 because customers also qualify for the Low-Income Rider if they are eligible for the Supplemental Nutrition Assistance Program.

Q63. HOW DOES EPE PROPOSE TO RECOVER THE DISCOUNT PROVIDED BY PROPOSED THE LOW-INCOME RIDER?

A. EPE proposes recovering the discount provided by the Low-Income Rider within the Residential Service rate class by incorporating the discount into the customer charge paid by non-qualifying residential customers to maintain revenue neutrality and the full recovery of customer-related fixed costs allocated to the rate class. The discount adds $1.02 to the monthly customer charge paid by non-qualifying residential customers.

Q64. WILL THE PROPOSED INCREASE IN THE CUSTOMER CHARGE FOR THE RESIDENTIAL SERVICE RATE SIGNIFICANTLY REDUCE A CUSTOMER'S ABILITY TO CONTROL THEIR BILL BY MANAGING ENERGY USAGE?

A. No. Residential customers will still be able to maintain control of their electric bill by managing energy consumption and taking advantage of opportunities aimed at reducing their energy usage through energy efficiency programs or conservation. Under EPE's proposed residential rate design, for most customers the largest portion of the customer's bill will continue to be the energy charge, which is within the customer's control. The proposed Customer Charge represents approximately 15% of the base rate charges, which means that residential customers will continue to control 85% of the base rate charges on their monthly bill. For residential customers qualifying for the Low-Income Rider, the customer charge will represent zero percent of their monthly bill because the essential benefit provided by this rider is that qualifying customers do not pay the Customer Charge. The relative percentage impact of the proposed Customer Charge on residential customers' bills is lessened further when other rates and riders are considered.

Q65. HAS THE COMPANY COMPARED THE RESIDENTIAL BILLS UNDER CURRENT AND PROPOSED STANDARD SERVICE RATES?

A. Yes. Exhibit MC-07 shows a comparison of monthly residential bills, using the 720 kWh class average Residential monthly consumption for the Test Year Period. As shown in the exhibit's Chart 1, for the non-summer months, the average bill at proposed rates is ($98 Phase 1) $125 and $83 under current rates. For summer months, the bill is ($154 Phase 1) $195 under the proposed rates, compared to $126

under current rates.

Exhibit MC-07 Chart 2 provides the change in average bill for each month. For low average usage months, the increase in electric bills is approximately ($9 Phase 1) $28. For higher average usage months, the bill increase is approximately ($28 Phase 1) $69 per month, indicating a strong pricing signal to encourage power conservation.

Q66. WHAT CHANGES ARE PROPOSED FOR THE TOD RATE OPTION?

A. EPE is proposing to set the TOD Rate Customer Charge equal to the proposed Standard Service Rate Customer Charge. As explained previously, recovering these customer costs in the most appropriate manner, i.e., through the customer charge, means that the TOD Energy Charges offered under the rate provide the most accurate price signals.

In addition, the non-summer Energy Charge for the TOD Rate is also set equal to the proposed non-summer Energy Charge for the Standard Service Rate. This is because there is no reason for TOD customers to receive the benefit of a lower Energy Charge as compared to non-TOD customers during non-summer months, when EPE's system has sufficient capacity to serve both types of customers. This same approach is taken for all rate classes with optional TOD rates.

Finally, the Company is proposing to modify the On-Peak Energy Charge to embed within it a 100% recovery of the 4CP categorized production cost.

B. Rate No. 03 – Small General Service Rate

Q67. PLEASE DESCRIBE THE EXISTING STRUCTURE OF THE RATES OFFERED UNDER RATE NO. 03.

A. This rate schedule includes four monthly rate options: a Standard Service Rate, an opt-in Standard TOD Rate, an Alternative Service Rate, and an opt-in Alternative TOD Rate. The two Alternative Rate options do not include demand charges and are applicable to smaller usage customers whose maximum demand does not exceed 15 kW or whose monthly energy consumption does not exceed 7,000 kWh. The Standard Service Rate structure consists of a monthly Customer Charge and seasonally differentiated Demand and Energy Charges. The summer Demand and Energy Charges apply in the months of June through September.

The Standard TOD Rate consists of a monthly Customer Charge and seasonally differentiated Demand and Energy Charges. The Energy Charge applies based on the month, day, and hour that usage occurs. The summer Demand Charge applies in the months of June through September. The On-Peak Period Energy Charge applies from 3:00 PM to 7:00 P.M., Monday through Friday during the summer period, and the seasonally differentiated Off-Peak Period Energy Charge applies during all other hours. Like EPE's other TOD rates, the summer period is defined as June through September.

The Alternative Service Rate consists of a monthly Customer Charge and a

seasonally differentiated Energy Charge. The summer Energy Charge applies in the months of June through September.

The Alternative TOD Rate consists of a monthly Customer Charge and a seasonally differentiated Energy Charge that applies based on the month, day, and hour that usage occurs. The On-Peak Period Energy Charge applies from 3:00 PM to 7:00 P.M., Monday through Friday during the summer period, and the seasonally differentiated Off-Peak Period Energy Charge applies during all other hours. Like EPE's other TOD rates, the summer period applies to the months of June through September.

Q68. WHAT CHANGES DOES EPE PROPOSE FOR THE RATE NO. 03 RATES AND RATE STRUCTURES?

A. For the Standard Service Rate, EPE is proposing to:

(1) set the monthly Customer Charge to collect all the customer-related costs;

(2) set the Demand Charges to recover 74% of demand-related costs;

(3) set the price differential between the seasonal Demand Charges to allow recovery in the summer demand charge of 67% of the sum of the 4CP and the excess related, 4CP-A&E categorized production and transmission costs; and

(4) set the price differential between the seasonal Energy Charges to recover 100% of the 4CP categorized production costs in the summer Energy Charges.

For the Standard TOD Rate, EPE is proposing to:

(1) set the monthly Customer Charge equal to the Standard Service Rate Monthly Customer Charge;

(2) set the summer and non-summer Off-Peak Energy Charge equal to the Standard Service Rate non-summer Energy Charge;

(3) set the summer and the non-summer Demand Charges equal to Standard Service Rate Demand Charges, respectively; and

(4) adjust the on-peak adder component of the On-Peak Energy Charge to recover 100% of the 4CP categorized production costs.

For the Alternative Service Rate, EPE is proposing to:

(1) set the monthly Customer Charge equal to the Standard Service Rate Monthly Customer Charge; and

(2) set the price differential between the seasonal Energy Charges to allow recovery of 67% of the sum of the 4CP and the excess related, 4CP-A&E categorized production and transmission costs in the summer Energy Charge.

For the Alternative TOD Rate, EPE is proposing to:

(1) set the monthly Customer Charge equal to the Standard Service Rate Monthly Customer Charge;

(2) set the non-summer Off-Peak Energy Charge equal to the Alternative Service Rate non-summer Energy Charge; and

(3) adjust the on-peak adder component of the On-Peak Energy Charge to recover 100% of the 4CP categorized production costs.

EPE is also proposing a new Experimental Off-Peak Demand Rate, as described below.

Q69. WHY IS EPE PROPOSING TO INCREASE THE CUSTOMER CHARGE FOR THE SMALL GENERAL SERVICE RATE?

A. EPE proposes to increase the monthly Customer Charge for Small General Service from $14.00 to $16.90 to accurately reflect the customer-related costs determined by its cost-of-service study. Exhibit MC-01, at tab NM L-1 Full COS, shows that the customer-related costs for the Small General Service rate class, based on the cost-of-service study, amount to $16.873 per month. Without an increase to the Customer Charge, EPE will recover only 83.0% of the customer-related costs through the customer charge.

Q70. WHY IS EPE PROPOSING TO SET DEMAND CHARGES AND THE PRICE DIFFERENTIAL BETWEEN THE SUMMER AND NON-SUMMER DEMAND AND ENERGY CHARGES SO THAT THE SUMMER CHARGES RECOVER LESS THAN 100% OF THE SUMMER PEAK-RELATED COSTS?

A. As noted previously, EPE is proposing rate structures that send pricing signals that communicate the higher costs incurred by EPE to meet summer months' loads. However, EPE is proposing to implement price differentials at a level below 100%

to balance improved cost-based pricing signals with limiting bill impacts to customers.

Q71. HAS THE COMPANY ANALYZED THE IMPACT OF THE PROPOSED STANDARD SERVICE RATES ON SMALL GENERAL SERVICE CUSTOMERS WITH VARIOUS USAGE CHARACTERISTICS?

A. Yes. Exhibit MC-02 provides seasonal and annual bill impacts based on various levels of electric usage.

Q72. PLEASE DESCRIBE THE PROPOSED EXPERIMENTAL OFF-PEAK DEMAND RATE FOR RATE NO. 03.

A. The Off-Peak Demand Rate is proposed as an experimental rate option available to customers who must take service under the Rate No. 03 Standard, or who could opt in for service under the Standard TOD Rate option, and who have a low load factor — defined as a twelve-month average load factor of less than 30%. The Off-Peak Demand Rate structure consists of a monthly Customer Charge and has the same non-summer Demand Charge and seasonally differentiated Off-Peak Period Energy Charge as those offered under the Standard TOD Rate. However, the On-Peak Period Energy Charge is significantly higher and, rather than a single summer Demand Charge, the Experimental Off-Peak Demand Rate has both an Off-Peak Demand Charge and an On-Peak Period Demand Charge that apply in the summer

months. The On-Peak Period Demand Charge applies to the maximum measured demand during the on-peak period for the billing cycle, while the Off-Peak Demand Charge applies to the maximum demand during the off-peak period.

Q73. WHY IS EPE PROPOSING TO ADD THE EXPERIMENTAL OFF-PEAK DEMAND RATE TO RATE NO. 03?

A. The proposed Experimental Off-Peak Demand Rate is designed to provide a strong financial incentive to encourage shifting maximum demand to the off-peak period or reducing it during the on-peak period. Customers that can do this would both lower their electric bills and assist in lowering EPE's summer peak demand, which would benefit all customers by reducing the demand that EPE must meet through its own generation or through power purchases.

Q74. WHAT IS THE EXPECTED IMPACT OF THE RATE 03 EXPERIMENTAL OFF-PEAK DEMAND RATE?

A. As shown in Exhibit MC-08, the proposed Experimental Off-Peak Demand Rate is expected to have several measurable impacts on participating Rate No. 03 customers and on EPE's system. Some of these impacts include:

1. Meaningful participation potential.

   The analysis in Exhibit MC-08 shows that 225 (out of approximately 1,600) of Rate No. 03 Standard Rate customers over the 12-month Base Period had a load

factor less than or equal to 30% and a maximum demand greater than or equal to 15 kW, making them eligible for this Rate. This indicates that a modest number of customers could benefit from the proposed experimental rate if they can avoid the on-peak period charges.

2. A reduction in system peak demand.

Given the eligible customer base, a reduction in on-peak demand from even a portion of these eligible customers would reduce EPE's summer peak demand requirements, which may help reduce the need for additional capacity resources. If the customers eligible for this rate, described above, can avoid the on-peak period entirely, then the reduction in peak demand could be approximately 4.0 megawatts ("MW"), based on the number of eligible customers and their measured demand during the on-peak period of the test year period.

3. Revenue neutrality.

Because the Experimental Off-Peak Demand Rate includes higher on-peak energy charges and additional demand charge components, the rate structure is designed to maintain overall revenue recovery while providing customers with a financial incentive to shift demand away from the on-peak period. However, to minimize revenue recovery risk, participation may be limited by the Company at its own discretion during this experimental phase or suspended indefinitely after evaluating the revenue impact of the rate and providing

notification to participants of such suspension.

C. Rate No. 04 – General Service Rate

Q75. PLEASE DESCRIBE THE EXISTING STRUCTURE OF THE RATES OFFERED UNDER RATE NO. 04.

A. This rate schedule includes two monthly rate options: a Standard Service Rate and an opt-in TOD Rate. Both rate options include Demand Charges that are differentiated for service at secondary, primary and transmission voltage levels. The Standard Service Rate structure consists of a monthly Customer Charge and seasonally differentiated Demand and Energy Charges. The summer Demand and summer Energy Charges apply in the months of June through September.

The TOD Rate consists of a monthly Customer Charge and seasonally differentiated Demand and Energy Charges. The Energy Charge applies based on the month, day, and hour that usage occurs. The summer Demand Charge applies in the months of June through September. The On-Peak Period Energy Charge applies from 3:00 to 7:00 P.M., Monday through Friday during the summer period, and the seasonally differentiated Off-Peak Period Energy Charge applies during all other hours. Like EPE's other TOD rates, the summer period is defined as June through September.

Q76. WHAT CHANGES DOES EPE PROPOSE FOR RATE NO. 04 RATES AND RATE STRUCTURES?

A. For the Standard Service Rate, EPE is proposing to:

(1) set the monthly Customer Charge to collect all the customer-related costs;

(2) set the Demand Charges to recover 75% of demand-related costs;

(3) set the price differential between the seasonal Energy Charges and between the seasonal Demand Charges to allow recovery of 88% of the sum of the 4CP and the excess related, 4CP-A&E categorized production and transmission costs through the summer charges; and

(4) set the price differential between the seasonal Energy Charges to recover 100% of the 4CP categorized production costs through the summer charges.

For the TOD Rate, EPE is proposing to:

(1) set the monthly Customer Charge equal to the Standard Service Rate Monthly Customer Charge;

(2) set the non-summer Off-Peak Energy Charge and the Demand Charges equal to those of the Standard Service Rate, respectively; and

(3) adjust the on-peak adder component of the On-Peak Energy Charge to recover 100% of the 4CP categorized production costs.

EPE is also proposing a new Experimental Off-Peak Demand Rate and a new Experimental TOD Demand Rate, as described below.

Q77. WHY IS EPE PROPOSING TO INCREASE THE CUSTOMER CHARGE FOR THE GENERAL SERVICE RATE?

A. EPE is proposing to increase the monthly Customer Charge for General Service from $26.00 to $104.64 to accurately reflect the customer-related costs determined by its cost-of-service study. Exhibit MC-01, at tab NM L-1 Full COS, shows that the customer-related costs for the General Service rate class, based on the cost-of-service study, amount to $104.679 per month. Without an increase to the Customer Charge, EPE will recover only 24.8% of the customer-related costs through the customer charge. The proposed Customer Charge is 2.46% of the average bill for this rate class for secondary service and 1.64% of the average bill for this rate class for primary service.

Q78. PLEASE DESCRIBE THE PROPOSED EXPERIMENTAL OFF-PEAK DEMAND RATE FOR RATE NO. 04.

A. The Off-Peak Rate is proposed as an experimental rate option available to secondary voltage Rate 04 customers who have a low load factor—defined as a twelve-month average load factor of less than 30%. The Off-Peak Demand Rate structure consists of a monthly Customer Charge and has the same non-summer Demand Charge and seasonally differentiated Off-Peak Period Energy Charge as those offered under the TOD Rate option. However, the On-Peak Period Energy Charge is significantly higher and, rather than a single summer Demand Charge,

the Experimental Off-Peak Demand Rate has both an Off-Peak Demand Charge and an On-Peak Period Demand Charge that apply in the summer months. The On-Peak Period Demand Charge applies to the maximum measured demand during the on-peak period for the billing cycle, while the Off-Peak Demand Charge applies to the maximum demand during the off-peak period.

Q79. WHY IS EPE PROPOSING TO ADD THE EXPERIMENTAL OFF-PEAK DEMAND RATE TO RATE NO. 04?

A. The proposed Experimental Off-Peak Demand Rate is designed to provide a strong financial incentive to encourage shifting maximum demand to the off-peak period or reducing it during the on-peak period. Customers that can do this would both lower their electric bills and assist in lowering EPE's summer peak demand, which would benefit all customers by reducing the demand that EPE must meet through its own generation or through power purchases.

Q80. WHAT IS THE EXPECTED IMPACT OF THE RATE 04 EXPERIMENTAL OFF-PEAK DEMAND RATE?

A. As shown in Exhibit MC-08, the proposed Experimental Off-Peak Demand Rate is expected to have several measurable impacts on participating Rate No. 04 customers and on EPE's system. Some of these impacts include:

1. Meaningful participation potential.

The analysis in Exhibit MC-08 shows that 73 (out of 602) of Rate No. 04 customers over the 12-month Base Period had a load factor less than or equal to 30% and a maximum demand greater than or equal to 50 kW, making them eligible for this Rate. This indicates that a modest number of customers could benefit from the proposed experimental rate if they can avoid the on-peak period charges.

2. A reduction in system peak demand.

Given the eligible customer base, a reduction in on-peak demand from even a portion of these eligible customers would reduce EPE's summer peak demand requirements, which may help reduce the need for additional capacity resources. If the customers eligible for this rate, described above, can avoid the on-peak period entirely, then the reduction in peak demand could be approximately 7.3 MW, based on the number of eligible customers and their measured demand during the on-peak period of the test year period.

3. Revenue neutrality.

Because the Experimental Off-Peak Demand Rate includes higher on-peak energy charges and additional demand charge components, the rate structure is designed to maintain overall revenue recovery while providing customers with a financial incentive to shift demand away from the on-peak period. However, to minimize revenue recovery risk, participation may be limited by the Company at its own discretion during this experimental phase or suspended indefinitely after evaluating the revenue impact of the rate and providing notification to participants

of such suspension.

Q81. PLEASE DESCRIBE THE PROPOSED EXPERIMENTAL TOD DEMAND RATE FOR RATE NO. 04.

A. The Experimental TOD Demand Rate is proposed as an experimental rate option available to secondary voltage customers who qualify under Rate No. 04. The TOD Demand Rate structure consists of a monthly Customer Charge and seasonally differentiated Demand and Energy Charges. However, rather than a single seasonal Demand Charge, the TOD Demand Rate has Demand and Energy Charges which both apply based on the month, day, and hour that usage occurs. The On-Peak Period Demand Charge applies from 3:00 to 7:00 P.M., Monday through Friday during the summer period if the maximum measured demand of the billing cycle occurs during that on-peak period. The Off-Peak Period Demand Charge applies during all other hours. The Experimental TOD Demand Rate has the same non-summer Energy Charges, non-summer Demand Charges, and Off-Peak Period Energy Charges as those offered under the TOD Rate. Like EPE's other TOD rates, the summer period is defined as June through September.

Q82. WHY IS EPE PROPOSING TO ADD THE EXPERIMENTAL TOD DEMAND RATE TO SCHEDULE NO. 04?

A. The proposed TOD Demand rate is designed to provide a financial incentive to

encourage shifting maximum demand to the off-peak period rather than the on-peak period. Customers that can do this would both lower their electric bills and assist in lowering EPE's summer peak demand, which would benefit all customers by reducing the demand that EPE must meet through generation.

Q83. WHAT IS EPE'S APPROACH TO CALCULATING THE EXPERIMENTAL TOD DEMAND RATE FOR SCHEDULE NO. 04?

A. Like the approach for the design of the existing TOD rate option, the Experimental TOD Demand Rate is based on revenue neutrality. This approach will result in the annual rate class base-rate revenue being the similar amount whether all customers in the rate class choose to take service under the Standard Rate or under the TOD Rate or under the Experimental TOD Demand Rate. However, to minimize revenue recovery risk, participation may be limited by the Company at its own discretion during this experimental phase or suspended indefinitely after evaluating the revenue impact of the rate and providing notification to participants of such suspension.

D. Rate No. 05 – Irrigation Service Rate

Q84. PLEASE DESCRIBE THE EXISTING STRUCTURE OF RATES OFFERED UNDER RATE NO. 05.

A. This rate schedule includes two monthly rate options: a Standard Service Rate and

an opt-in TOD Rate. The Standard Service Rate structure consists of a monthly Customer Charge and seasonally differentiated Energy Charges. The summer Energy Charge applies in the months of June through September.

The TOD Rate consists of a monthly Customer Charge and a seasonally differentiated Energy Charge that applies based on the month, day, and hour that usage occurs. The On-Peak Period Energy Charge applies from 3:00 P.M. through 7:00 P.M., Monday through Friday during the summer period, and the seasonally differentiated Off-Peak Period Energy Charge applies during all other hours. Like EPE's other TOD rates, the summer period applies in the months of June through September.

Q85. WHAT CHANGES DOES EPE PROPOSE FOR THE RATE NO. 05 RATES AND RATE STRUCTURES?

A. For the Standard Service Rate, EPE is proposing to

(1) set the monthly Customer Charge to collect all the customer-related costs; and

(2) set the price differential between the seasonal Energy Charges to allow recovery of 50% of the sum of the 4CP and the excess related, 4CP-A&E categorized production and transmission costs through the summer Energy Charges.

For the TOD Rate, EPE is proposing to:

(1) set the monthly Customer Charge equal to the Standard Service Rate Monthly

Customer Charge;

(2) set the non-summer Off-Peak Energy Charge equal to the Standard Service Rate non-summer Energy Charge; and

(3) adjust the on-peak adder component of the On-Peak Energy Charge to recover 100% of the 4CP categorized production costs.

E. Rate No. 07 – City And County Service

Q86. PLEASE DESCRIBE THE EXISTING STRUCTURE OF THE RATES OFFERED UNDER RATE NO. 07.

A. This rate schedule includes two monthly rate options: a Standard Service Rate and an opt-in TOD Rate. The Standard Service Rate structure consists of a monthly Customer Charge and seasonally differentiated Demand and Energy Charges. The summer Demand and summer Energy Charges apply in the months of June through September.

The TOD Rate consists of a monthly Customer Charge and seasonally differentiated Demand and Energy Charges. The Energy Charge applies based on the month, day, and hour that usage occurs. The summer Demand Charge applies in the months of June through September. The On-Peak Period Energy Charge applies from 3:00 P.M. to 7:00 P.M., Monday through Friday during the summer period, and the seasonally differentiated Off-Peak Period Energy Charge applies during all other hours. Like EPE's other TOD rates, the summer period is defined

as June through September.

Q87. WHAT CHANGES DOES EPE PROPOSE FOR RATE NO. 07 RATES AND RATE STRUCTURES?

A. For the Standard Service Rate, EPE is proposing to

(1) set the monthly Customer Charge to collect all the customer-related costs;

(2) set the Demand Charges to recover 76% of demand-related costs;

(3) set the price differential between the seasonal Energy Charges and between the seasonal Demand Charges to allow recovery of 66% of the sum of the 4CP and the excess related, 4CP-A&E categorized production and transmission costs through the summer charges; and

(4) set the price differential between the seasonal Energy Charges to recover 100% of the 4CP categorized production costs through the summer energy charge.

For the TOD Rate, EPE is proposing to:

(1) set the monthly Customer Charge equal to the Standard Service Rate Monthly Customer Charge;

(2) set the non-summer Off-Peak Energy Charge and the Demand Charges equal to those of the Standard Service Rate, respectively; and

(3) adjust the on-peak adder component of the On-Peak Energy Charge to recover 100% of the 4CP categorized production costs.

F. Rate No. 08 – Water, Sewage, Storm Sewage Pumping Service

Q88. PLEASE DESCRIBE THE EXISTING STRUCTURE OF THE RATES OFFERED UNDER RATE NO. 08.

A. This rate schedule includes two monthly rate options: a Standard Service rate and an opt-in TOD Rate. Both rate options include rates that are differentiated for service at secondary and primary voltage levels. The Standard Service Rate consists of a monthly Customer Charge and a seasonally differentiated Energy Charge. The summer Energy Charges apply in the months of June through September.

The TOD Rate consists of a monthly Customer Charge and a seasonally differentiated Energy Charge that applies based on the month, day, and hour that usage occurs. The On-Peak Period Energy Charge applies from 3:00 P.M. through 7:00 P.M., Monday through Friday during the summer period, and the seasonally differentiated Off-Peak Period Energy Charge applies during all other hours. Like EPE's other TOD rates, the summer period is defined as June through September.

Q89. WHAT CHANGES DOES EPE PROPOSE FOR RATE NO. 08 RATES AND RATE STRUCTURES?

A. For the Standard Service Rate, EPE is proposing to

(1) set the monthly Customer Charge to collect all the customer-related costs; and

(2) set the price differential between the seasonal Energy Charges to allow recovery of 100% of the sum of the 4CP and the excess related, 4CP-A&E categorized production and transmission costs through the summer Energy Charge.

For the TOD Rate, EPE is proposing to:

(1) set the monthly Customer Charge equal to the Standard Service Rate Monthly Customer Charge;

(2) set the non-summer Off-Peak Energy Charge equal to the Standard Service Rate non-summer Energy Charge; and

(3) adjust the on-peak adder component of the On-Peak Energy Charge to recover 100% of the 4CP categorized production costs.

G. Rate No. 09 – Large Power Service

Q90. PLEASE DESCRIBE THE EXISTING RATE STRUCTURE OF RATE NO. 09.

A. The rate structure consists of a monthly Customer Charge, a seasonally differentiated Demand Charge that is differentiated by primary, secondary and transmission service voltage, and a TOD Energy Charge. The Energy Charge applies based on the month, day, and hour that usage occurs. The summer Demand Charge applies in the months of June through September. The On-Peak Period Energy Charge applies from 3:00 P.M. to 7:00 P.M., Monday through Friday during

the summer period, and the Off-Peak Period Energy Charge applies during all other hours. Like EPE's other TOD rates, the summer period is defined as June through September.

Q91. WHAT RATE CHANGES DOES EPE PROPOSE FOR RATE NO. 09?

A. EPE is proposing to:

(1) set the monthly Customer Charge to collect all the customer-related costs;

(2) set the Demand Charges to recover 87% of demand-related costs;

(3) set the price differential between the On-Peak and Off-Peak Energy Charges and between the seasonal Demand Charges to allow recovery of 100% of the sum of the 4CP and the excess related, 4CP-A&E categorized production and transmission costs through the On-Peak Energy Charge and summer Demand Charge; and

(4) adjust the on-peak adder component of the On-Peak Energy Charge to recover 100% of the 4CP categorized production costs.

Q92. WHY IS EPE PROPOSING TO INCREASE THE CUSTOMER CHARGE FOR THE LARGE POWER SERVICE RATE?

A. EPE is proposing to increase the monthly Customer Charge for Large Power Service from $127.00 to $1,480.68 to accurately reflect the customer-related costs determined by its cost-of-service study. Exhibit MC-01, at tab NM L-1 Full COS,

shows that the customer-related costs for the Large Power Service rate class, based on the cost-of-service study, amount to $1,481.157 per month. Without an increase to the Customer Charge, EPE will recover only 8.6% of the customer-related costs through the customer charge. The proposed Customer Charge is 4.19% of the average bill for this rate class for secondary service and 2.49% for primary service.

H. Rate No. 10 – Military Research and Development Power Service

Q93. PLEASE DESCRIBE THE EXISTING RATE STRUCTURE OF RATE NO. 10.

A. This rate schedule includes two rate options: Option A - Standard Service Rate and Option B - Enhanced Service Rate. Since 2018, the Enhanced Service Rate customer takes service from an EPE-owned solar photovoltaic generation facility located behind the substation meter which directly feeds the power requirements of the customer. EPE's CCOS accounts for the effect of system wide benefits attributed to this facility, which is recognized in the production cost allocation factors specific to the customer served under this rate option.

The rate structure of both rate options consists of a monthly Customer Charge, a seasonally differentiated Demand Charge, and a TOD Energy Charge. The Energy Charge applies based on the month, day, and hour that usage occurs. The summer Demand Charges apply in the months of June through September. The On-Peak Period Energy Charge applies from 300 P.M. to 7:00 P.M., Monday through

Friday during the summer period, and the Off-Peak Period Energy Charge applies during all other hours. Like EPE's other TOD rates, the summer period is defined as June through September.

Q94. WHAT RATE CHANGES DOES EPE PROPOSE FOR THE RATE NO. 10 OPTIONS A & B?

A. EPE is proposing to:

(1) set the monthly Customer Charge to collect all the customer-related costs;

(2) set the Demand Charges to recover 82% of demand-related costs;

(3) set the price differential between the On-Peak and Off-Peak Energy Charges and between the seasonal Demand Charges to allow recovery of 100% of the sum of the 4CP and the excess related, 4CP-A&E categorized production and transmission costs through the On-Peak Energy Charge and summer Demand Charge; and

(4) adjust the on-peak adder component of the On-Peak Energy Charge to recover 100% of the 4CP categorized production costs.

Q95. WHY IS EPE PROPOSING TO INCREASE THE CUSTOMER CHARGE FOR THE MILITARY R&D POWER SERVICE RATE?

A. EPE is proposing to increase the monthly Customer Charge for Military R&D Power Service from $220.00 to $3,205.35 for Option A and ($2,331.77 Phase 1)

$3,127.22 for Option B to reflect the customer-related costs determined by its cost-of-service study. Exhibit MC-01, at tab NM L-1 Full COS, shows that the customer-related costs for the Military R&D Power Service rate class, based on the cost-of-service study, amount to $3,206.742 for Option A and $3,128.609 for Option B per month. Not increasing the Customer Charge would result in it recovering only 6.9% of the customer-related costs for Option A and 7.0% for Option B through the customer charge. The proposed Customer Charges are 0.82% and 0.99% of the Option A and the Option B average bills, respectively.

I. Rate No. 15 – Miscellaneous Service Charges

Q96. PLEASE DESCRIBE THE EXISTING RATE STRUCTURE OF RATE NO. 15.

A. Rate No. 15 – Miscellaneous Service Charges is applicable to all customers and lists charges and fees for services performed by EPE that are not at the core of its utility service (e.g., generation/procurement of power, transmission and distribution of the power, metering and billing, administrative support of these functions). The vast majority of these charges and fees are assessed on a one-time or as needed basis.

Q97. IS EPE SEEKING A CHANGE TO ANY OF THE CHARGES FOUND IN ITS RATE NO. 15?

A. Yes. Please refer to the direct testimony of EPE witness Rene Gonzalez for discussion of the changes to this schedule for the activity-based charges. EPE is also proposing to add a Facilities Plus Rental Charge and a Transmission Facilities Charge which will provide for recovery of and on the Company's investment in infrastructure, particularly substations, which are specifically built and dedicated to serve the requesting customer. The expectation is to apply the Facilities Plus Rental Charge to sub-transmission and primary voltage customers and the Transmission Facilities charge to customers with connected loads equal to or exceeding 69 kV.

Q98. HOW WERE THE FACILITIES PLUS RENTAL AND THE TRANSMISSION FACILITIES CHARGES DETERMINED?

A. Both charges are based on data from EPE's functional cost-of-service study, and the calculations are included in the rate design workpaper, Workpaper O.1 at tab Fixed Charges. In general, the charges are expressed as a percentage of a facility's investment cost because the facilities charge is intended to recover the annual costs associated with the underlying facility, rather than the facility's investment cost itself. The percentage-of-cost formulation incorporates O&M, property tax, depreciation, and revenue-related expenses, and a cost of capital component.

J. Rate No. 19 – Seasonal Agriculture Processing Service

Q99. PLEASE DESCRIBE THE EXISTING RATE STRUCTURE OF RATE

NO. 19.

A. The rate structure consists of a monthly Customer Charge and a seasonally differentiated Energy Charge. The summer Energy Charge applies in the months of June through September.

Q100. WHAT CHANGES DOES EPE PROPOSE FOR THE RATE SCHEDULE NO. 19 RATES AND RATE STRUCTURES?

A. EPE is proposing to:

(1) set the monthly Customer Charge to collect all the customer-related costs; and

(2) set the price differential between the seasonal Energy Charges to allow recovery of 100% of the sum of the 4CP and the excess related, 4CP-A&E categorized production and transmission costs through the summer Energy Charge.

K. Rate No. 25 – Outdoor Recreational Lighting Service Rate

Q101. PLEASE DESCRIBE THE EXISTING STRUCTURE OF RATES OFFERED UNDER RATE NO. 25.

A. The rate structure consists of a monthly Customer Charge and a flat Energy Charge.

Q102. WHAT CHANGES DOES EPE PROPOSE FOR THE RATE NO. 25 RATES AND RATE STRUCTURE?

A. EPE is proposing to:

(1) set the monthly Customer Charge to collect all the customer-related costs; and

(2) implement a seasonal price differential between the Energy Charges in the summer period and the non-summer period, as is done with the other rate classes, to allow recovery of 100% of the sum of the 4CP and the excess related, 4CP-A&E categorized production and transmission costs through the summer Energy Charge.

L. Rate No. 26 - State University Service

Q103. PLEASE DESCRIBE THE EXISTING RATE STRUCTURE OF RATE NO. 26.

A. The rate structure consists of a monthly Customer Charge, a seasonally differentiated Demand Charge, and a TOD Energy Charge. The Energy Charge applies based on the month, day, and hour that usage occurs. The summer Demand Charge applies in the months of June through September. The On Peak Period Energy Charge applies from 3:00 P.M. to 7:00 P.M., Monday through Friday during the summer period, and the Off Peak Period Energy Charge applies during all other hours. Like EPE's other TOD rates, the summer period is defined as June through September.

Q104. WHAT RATE CHANGES ARE PROPOSED FOR RATE NO. 26?

A. EPE is proposing to:

(1) set the monthly Customer Charge to collect all the customer-related costs;

(2) set the Demand Charges to recover 87% of demand-related costs;

(3) set the price differential between the On-Peak and Off-Peak Energy Charges and between the seasonal Demand Charges to allow recovery of 100% of the sum of the 4CP and the excess related, 4CP-A&E categorized production and transmission costs through the On-Peak Energy Charge and summer Demand Charge; and

(4) adjust the on-peak adder component of the On-Peak Energy Charge to recover 100% of the 4CP categorized production costs.

Q105. WHY IS EPE PROPOSING TO INCREASE THE CUSTOMER CHARGE FOR THE STATE UNIVERSITY SERVICE RATE?

A. EPE is proposing to increase the monthly Customer Charge for State University Service from $135.00 to ($3,894.75 Phase 1) $4,885.02 to reflect the customer-related costs determined by its cost-of-service study accurately. Exhibit MC-01, at tab NM L-1 Full COS, shows that the customer-related costs for the State University Service rate class, based on the cost-of-service study, amount to $4,886.640 per month. Not increasing the Customer Charge would result in it recovering only 2.8% of the customer-related costs through the customer charge.

The proposed Customer Charge is 2.17% of the average bill for this rate class.

M. Rate No. 29 – Interruptible Power Service

Q106. PLEASE DESCRIBE THE EXISTING RATE STRUCTURE OF RATE NO. 29.

A. The rate structure consists of a Demand Charge, differentiated by primary and secondary voltage service, and an Energy Charge.

Q107. WHAT RATE CHANGES ARE PROPOSED FOR RATE NO. 29?

A. EPE is proposing to include a Demand Charge for transmission voltage.

Q108. WHY IS EPE PROPOSING TO INCLUDE A TRANSMISSION VOLTAGE RATE IN RATE NO. 29?

A. EPE is proposing to include a Demand Charge for transmission voltage because it intends to make interruptible service available in conjunction with the implementation of the large load tariffs described later in this testimony.

Q109. HOW ARE THE RATE NO. 29 DEMAND AND ENERGY CHARGES CALCULATED?

A. Noticed Interruptible Power Service rates were designed based on capacity and energy costs allocated in the cost-of-service study to the Rate No. 09 Large Power

rate class. EPE first designs demand component unit costs so that all capacity-related fixed costs are assigned to each voltage level. These unit costs were then reduced to account for loss-adjusted avoided production capacity cost to determine the Rate No. 29 demand charge by voltage level. As explained earlier in my testimony, the avoided capacity cost is estimated based on the Newman Unit 6 costs. By reflecting only production capacity in the credit, no reduction is made to the allocated amount of transmission and distribution component costs. Furthermore, energy charges reflect only non-fuel variable costs allocated to the Large Power rate class, mostly variable operation and maintenance costs of $0.01134 per kWh. Development of the avoided production capacity cost for the interruptible credit is shown in Workpaper O.1.

EPE proposes to continue to move existing Interruptible demand charges towards full cost level. Therefore, a rate moderation adjustment is made that provides a credit that is higher than EPE's incremental capacity cost. This rate moderation adjustment has been used in designing interruptible service rates by EPE in other recently filed rate cases in both Texas and New Mexico.

Q110. WHAT IS THE IMPACT ON EXISTING NOTICED INTERRUPTIBLE CUSTOMERS OF THE CHANGES EPE IS PROPOSING?

A. The combination of the increase in the Rate No. 29 Demand Charge and the Energy Charge results in an overall base-rate revenue impact to non-firm service nearly

equivalent to EPE's system average increase proposed in this rate case. The net impact of the changes in interruptible rates is a function of the customer's firm and non-firm service level and the proposed changes in the rate schedule applicable to the customer's firm service.

N. Rate No. 42 – Experimental Electric Vehicle Charging

Q111. PLEASE DESCRIBE THE EXISTING RATE STRUCTURE OF RATE NO. 42.

A. The rate structure is a TOD rate which consists of a monthly Customer Charge and an Energy Charge that applies based on the month, day, and hour that usage occurs. Unlike the rate structure of EPE's most other TOD rate options, the TOD Energy Charge of Schedule No. 42 has three pricing periods: on-peak, off-peak, and super off-peak. The On-Peak Period Energy Charge applies from 3:00 P.M. to 7:00 P.M., Monday through Friday during the summer period, the Super Off-Peak Period Energy Charge applies from 12:00 A.M. through 8:00 A.M., year-round in all days, and the Off-Peak Period Energy Charge applies during all other hours.

Q112. WHAT CHANGES DOES EPE PROPOSE FOR THE RATE NO. 42 RATES AND RATE STRUCTURE?

A. The proposed monthly Customer Charge will be bifurcated into 1) a "combined service" charge for service provided using a line extension that serves both EV

charging and non-EV charging, and 2) a "single service" charge for service using a line extension that serves solely EV charging. The combined service Customer Charge will fully include the costs related to meters, services drops, and meter reading, which are the most relevant incremental customer-related cost to provide this service and to avoid the duplication in the recovery of other customer-related costs paid by customers through their non-EV charging rate schedule. The single service Customer Charge will include all customer-related costs to provide this service.[15] EPE is proposing to increase the monthly Customer Charge for Experimental Electric Vehicle Charging from $3.55 to $13.03 for combined service and to $17.03 for single service to reflect the customer-related costs determined by its cost-of-service study.

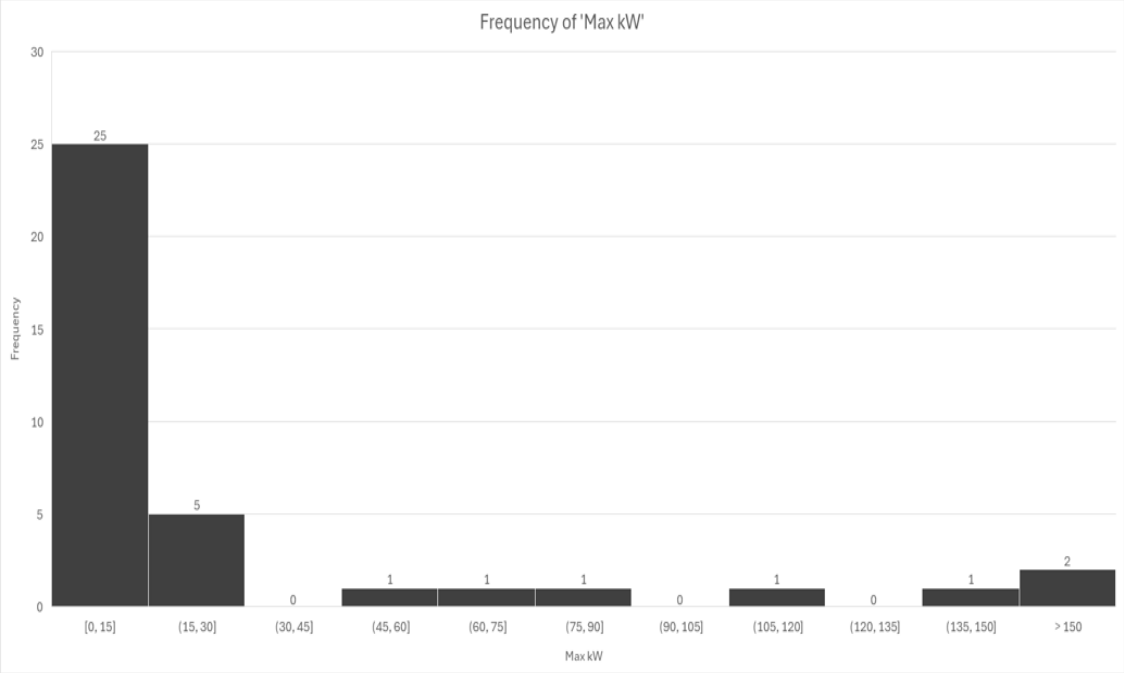
For new monthly loads for EV charging that are 15 kW or more, EPE is proposing a demand charge. To mitigate the impact of the proposed demand charge to any existing customer that is currently on Rate No. 42, EPE will defer applying demand charges to their bills until the effective date of this rate schedule in a subsequent rate case filing. However, if approved, this charge would apply to new Rate No. 42 customers.

[15] Since sales under Rate No. 42 have not arisen to a level significant enough to establish it as a rate class, there is no cost allocation to this rate schedule in EPE's CCOS. In subsequent rate cases, EPE expects to be able to more accurately allocate and assign costs to Rate No. 42 as load and consumption information becomes available.

Q113. WHY IS EPE PROPOSING A DEMAND CHARGE FOR RATE NO. 42?

A. EPE's load study for Rate No. 42 shows that non-coincident demands averaged between 18 kW and 37 kW during the Base Period. A frequency distribution of the data is provided in Figure MC-3 below.

Figure MC-3



Both sets of data indicate that significant load is being placed on the distribution facilities by a few customers to provide EV charging service under this rate. Because of EPE's investment in its distribution system, Rate No. 42 is proposed to include a limited demand charge so that new customers equitably

contribute toward the recovery of and on that investment which enables the high load EV charging. A demand charge for loads that are equal to or greater than 15 kW is consistent with EPE's other non-residential rate schedules that assess a minimum demand charge.[16] Figure MC-3 above shows that most customers will not be impacted by the proposed demand charge.

Q114. IS EPE PROVIDING THE EV-CHARGING INFORMATION IT AGREED TO PROVIDE IN THE LAST RATE CASE?

A. Yes. In the last NM rate case, EPE did not oppose Staff's recommendation that EPE be required to report the following information in its next base rate case:

- The number of customers taking service under the rate schedule by rate class, and the maximum.
- The number of customers that have taken service under the rate schedule at any one time since implementation.
- The average bill for Rate No. 42 customers.
- The load data and the load profile of Rate No.42 customers, including data on how the EV charging load coincides with EPE's system peak.

These reporting requirements can be found in the direct testimonies of EPE witnesses Rene Gonzalez and of Enedina Soto.

[16] The proposed demand charge is limited in this proceeding to the recovery of distribution system costs. In future proceedings, EPE will evaluate revising the demand charge to include the other system costs.

Q115. IN EPE'S TRANSPORTATION ELECTRIFICATION PLAN FILING, EPE COMMITTED TO EVALUATE REVISING THE SUPER OFF-PEAK PERIOD OF RATE NO. 42. HAS EPE PERFORMED THIS EVALUATION AND, IF SO, WHAT WERE THE RESULTS OF SUCH EVALUATION?[17]

A. Yes. EPE performed an analysis of the super off-peak period using historical hourly load data for the test year. EPE analyzed the lowest average native system load hours per month to determine whether the current super off-peak window (12 a.m. to 8 a.m.) continues to align with periods of consistently low system demand. The results show that, for every month in the Base Period, the lowest-load hours most commonly occur between 12 a.m. and 8 a.m. MST. One exception occurs in January, where the modal lowest-load window shifts later into the morning, reflecting seasonal winter load patterns. However, this shift occurs only for a subset of days and does not represent the predominant low-load period seen across the Base Period.

Because the overwhelming majority of months show the system's lowest hourly loads occurring within the existing 12 a.m. to 8 a.m. super-off peak period, the evaluation confirms that the current super off-peak period continues to align

[17] See Corrected Certification of Stipulation, *In The Matter Of El Paso Electric Company's Application For Approval Of Its Transportation Electrification Plan For 2021-2022*, Docket No. 20-00241-UT, filed October 24, 2021.

with typical low system demand. Based on these results, EPE determined that no revision to the super off-peak period is warranted at this time. See Table MC-4 below for the summary of the analysis.

Table MC-4 Hour of Lowest Daily Demand

VI. OTHER RATE SCHEDULES

Q116. IS EPE SEEKING RATE OR RATE STRUCTURE CHANGES TO ANY OTHER RATE SCHEDULES?

A. Yes. Some rate schedules need to be revised due to the dependencies to the changes in rates of other rate schedules. Other rate schedules are proposed to be changed to comply with the Commission requirements in prior filings. These other rate schedules consist of rate schedules applicable to qualifying facilities (i.e., Rate Nos. 21, 22, 23, and 24).

Q117. WHAT RATE CHANGES ARE PROPOSED FOR SERVICE RATE SCHEDULES APPLICABLE TO QUALIFYING FACILITIES?

A. EPE proposes to only revise the delivery service charges and interconnection charges in these rate schedules applicable to qualifying facilities.

VII. LARGE LOAD TARIFF SCHEDULES

Q118. PLEASE DESCRIBE THE NEW LARGE LOAD TARIFF SCHEDULES PROPOSED IN THIS APPLICATION.

A. EPE is requesting Commission approval of the Original Rate No. 50 – High Load Factor Service Rate ("Rate 50") and the Original Rate No. 51 – Large Load Service Rate ("Rate 51") (collectively, "Large Load") tariff schedules. The proposed Large Load tariff schedules are included as Exhibits MC-9 and MC-10, respectively. Under EPE's existing Commission-approved tariff schedules, large load customers, such as data center facilities, would be served under the then-effective version of Rate No. 9 – Large Power Service. The expected loads profiles for these facilities,

however, are unlike any loads profile of customers currently served under Rate No. 9 or any of EPE's other existing tariff schedules. Thus, EPE decided to utilize large load tariff schedules to reflect the unique service characteristics of large load facilities. The proposed Large Load tariff schedules contain many of the provisions of the Rate No. 9 tariff schedule. The most significant differences from the Rate No. 9 provisions, other than the monthly rates section, are in the applicability and determination of billing demand provisions.

Q119. DID YOU REVIEW ANY INDUSTRY LITERATURE TO DEVELOP THE PROPOSED LARGE LOAD TARIFF SCHEDULES?

A. Yes. Although EPE has experience with large load customers, as described in each section below, the recent types of large load customers, namely data centers and artificial intelligence ("AI") applications, necessitated a review of the latest trends in serving these types of customers. The proposed tariff schedules (and the energy service agreement template in Mr. Novela's Exhibit GN-2) attempt to strike a balance between offering cost-based rates to large load customers while also protecting other customers from the burden of cost shifts and protecting EPE from the risk of not recouping its investments.

Q120. DO THE PROPOSED LARGE LOAD TARIFF SCHEDULES APPLY TO CUSTOMERS WITH SPECIFIC END USES OF ELECTRICITY?

A. No. As long as the Company and the customer agree that its facility's needs meet the applicability criteria of the tariff schedules, they will apply regardless of the customer's end use of the electricity.

Q121. WHAT IS A GOOD EXAMPLE OF A CUSTOMER THAT WOULD QUALIFY FOR SERVICE UNDER EACH PROPOSED TARIFF SCHEDULE?

A. A hyper-scale data center is a good example of the type of customer that could be served under Rate 50 because such facilities typically have very large and relatively constant electric loads, often exceeding 25 MW, and maintain high load factors due to their continuous operations. A manufacturing and testing facility of components used in data center operations could be served under Rate 51 because such facilities may operate with loads of 10 MW or higher but may experience more variability in monthly load factors depending on production or testing schedules.

Q122. THE TARIFF SCHEDULES MENTION AN ENERGY SERVICE AGREEMENT. CAN SERVICE UNDER EITHER TARIFF SCHEDULE BE PROVIDED WITHOUT SUCH SERVICE AGREEMENT?

A. No. An energy service agreement ("ESA") must be executed to qualify for service under the Large Load tariff schedules. Furthermore, EPE proposes that the ESA will be filed by the Company with the Commission prior to taking service under

the rate schedules. Please refer to Mr. Novela's direct testimony for the discussion of the provisions of the ESA template.

Q123. PLEASE DESCRIBE, IN GENERAL, THE PROPOSED RATE NO. 50 – HIGH LOAD FACTOR POWER SERVICE RATE.

A. Proposed Rate No. 50 would apply to facilities operating at 30 megawatts ("MW") or higher and with monthly load factors averaging 85% or higher.

Q124. HOW WAS THE RATE 50 THRESHOLD OF 30 MW DETERMINED?

A. The Rate 50 threshold of 30 MW threshold was selected because, as discussed by EPE witness Omar Gallegos, it equates to the capacity of a substation power transformer for a transmission voltage customer. The threshold is also consistent with the review of several large load tariff schedules that other electric utilities across the nation have implemented to serve large load customers that exhibit high loads. Based on Mr. Gallegos' testimony and the benchmarking review, EPE determined the 30 MW threshold is a reasonable level that distinguishes very large, high load factor facilities from other industrial or commercial customers while also aligning with thresholds commonly used by other utilities.

Q125. WHAT IS LOAD FACTOR AND HOW WAS THE 85% THRESHOLD FOR RATE 50 DETERMINED?

A. Load factor, in the context of a rate schedule, is an index of the efficiency of the usage pattern of each individual customer served under the rate schedule. Load factor is defined as the ratio of the average to the maximum (peak) load in the billing month. A customer would have to consume, on average, approximately 18,615 MW-hours each month to meet the applicability criteria to be served under Rate 50.[18] Like the 30 MW threshold, the 85% load factor threshold was determined by reviewing the large load tariff schedules that other electric utilities across the nation have implemented to serve large load customers that exhibit high load factors.

Q126. DOES EPE HAVE ANY TARIFF SCHEDULE IN ITS TEXAS SERVICE AREA FOR CUSTOMERS THAT EXHIBIT LARGE LOADS AND CONSISTENTLY HIGH MONTHLY LOAD FACTORS?

A. Yes. Texas Rate Schedule No. 26 – Petroleum Refinery Service Rate provides service to a customer that has recently averaged nearly 54 MW per month with monthly load factors consistently exceeding 91%.

Q127. HOW WERE THE CHARGES IN THE MONTHLY RATES PROVISION OF RATE 50 DETERMINED?

[18] 30 MW x 730 hours/month x 85% load factor = 18,615.

A. The source for the Rate 50 charges is a cost-of-service study and rate design model for a hypothetical rate class for a 100 MW hyperscale data center that operates at an 85% load factor. The hypothetical high load factor rate class was added to the cost-of-service model to allocate the New Mexico revenue requirement to all rate classes. The customer, demand, and energy charges are designed to fully recover the allocated revenue requirement of the hypothetical rate class.

Like EPE's other three-part rate designs, EPE is proposing to:

(1) set the monthly Customer Charge to collect all the customer-related costs;

(2) set the Demand Charges to recover 72% of demand-related costs;

(3) set the price differential between the On-Peak and Off-Peak Energy Charges and between the seasonal Demand Charges to allow recovery of 97% of the sum of the 4CP and the excess related, 4CP-A&E categorized production and transmission costs from the On-Peak Energy Charge and summer Demand Charge; and

(4) adjust the on-peak adder component of the On-Peak Energy Charge and the On-Peak Demand Charge to recover 100% of the 4CP categorized production costs.

Q128. WHY IS THE DETERMINATION OF BILLING DEMAND PROVISION NECESSARY?

A. Such provision ensures greater opportunity of cost recovery of the Company's investment and operating costs in providing service to the customer. It also helps mitigate concerns about shifting costs caused by very large load customers to other customers.

Q129. PLEASE PROVIDE EXAMPLES OF HOW THE DETERMINATION OF BILLING DEMAND PROVISION WILL OPERATE.

A. The provision states that billing demand will be the highest of four criteria: 1) the maximum demand, which is the highest measured demand during the billing month; or 2) 80% of the contract capacity; or 3) 80% of the highest measured demand measured during the prior billing months of June through September; or 4) 30 MW, but in kilowatts. Exhibit MC-11 provides examples in which each of these criteria would result in the application of the demand charge.

Q130. PLEASE DESCRIBE, IN GENERAL, THE PROPOSED RATE NO. 51 – LARGE LOAD POWER SERVICE RATE?

A. Proposed Rate No. 51 would apply to facilities operating at 10 MW or higher and monthly load factors that can vary from month to month.

Q131. HOW WAS THE RATE 51 THRESHOLD OF 10 MW DETERMINED?

A. The Rate 51 threshold of 10 MW was determined by considering that some large

load customers could place greater financial risk for the Company if they are served under Rate 09. The 10 MW minimum ensures that the eligible customers are aware of the extra requirements to obtain the service to meet their needs.

Q132. DOES EPE HAVE ANY TARIFF SCHEDULE IN ITS TEXAS SERVICE AREA FOR CUSTOMERS THAT EXHIBIT LARGE LOADS AND MONTHLY VARYING LOAD FACTORS?

A. Yes. Texas Rate Schedule No. 15 – Electrolytic Refining Service Rate provides service to a customer that has recently averaged nearly 14 MW per month with monthly load factors ranging between 45% and 77%.

Q133. HOW WERE THE CHARGES IN THE MONTHLY RATES PROVISION OF RATE 51 DETERMINED?

A. The source for the Rate 51 charges is a cost-of-service study and rate design model for a hypothetical rate class for a 25 MW AI training center that operates at a 45% load factor. The hypothetical large load rate class was added to the cost-of-service model to allocate the New Mexico revenue requirement to all rate classes. The customer, demand, and energy charges are designed to fully recover the allocated revenue requirement of the hypothetical rate class.

Like EPE's other three-part rate designs, EPE is proposing to:

(1) set the monthly Customer Charge to collect all the customer-related costs;

(2) set the Demand Charges to recover 73% of demand-related costs;

(3) set the price differential between the On-Peak and Off-Peak Energy Charges and between the seasonal Demand Charges to allow recovery of 93% of the sum of the 4CP and the excess related, 4CP-A&E categorized production and transmission costs from the On-Peak Energy Charge and summer Demand Charge; and

(4) adjust the on-peak adder component of the On-Peak Energy Charge and the On-Peak Demand Charge to recover 100% of the 4CP categorized production costs.

Q134. COMPARE AND CONTRAST THE TARIFF PROVISIONS OF RATE 50 AND RATE 51.

A. Both tariff schedules are at transmission voltage, exhibit seasonal and time-varying rates, have the same similar determination of billing demand criteria, and require the execution of an ESA. The primary difference, however, is in the MW and load factor thresholds, and the monthly rates.

Q135. IS EPE PROPOSING TO ESTABLISH NEW LARGE LOAD CUSTOMER RATE CLASSES IN ITS COST-OF-SERVICE STUDIES?

A. Yes. Customer rate classifications are used to group customers with similar usage characteristics for the purpose of allocating costs in cost-of-service studies. EPE

finds it necessary to propose Large Load tariff schedules because the expected loads are unlike any loads and usage of current customers. However, because these types of customers are new to its service area, EPE existing cost-of-service study does not include "large load" customer rate classifications from which cost-based prices could be derived. A cost-of-service study is a key factor in developing more transparent, cost-based pricing for tariff schedules. Therefore, EPE is also proposing to create Large Load rate classes at this time to have a rate for such customers when they appear, which will allow EPE to gather the fully operational and the associated load requirements data necessary to establish rates and terms applicable to qualifying customers in a subsequent rate case test year.

Q136. HAVE YOU INCLUDED A WORKPAPER WITH ALL THE CALCULATIONS DESCRIBED ABOVE AS AN EXHIBIT TO THIS TESTIMONY?

A. Yes. Exhibit MC-12 is a workpaper that includes all the cost of service and rate design calculations that support this section of this testimony.

VIII. PEAK TIME REBATE PILOT PROGRAM

Q137. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR TESTIMONY?

A. In this section of my testimony, I discuss EPE's proposal to implement the Peak Time Rebate Pilot Program, which will provide those customers that participate in

the program the opportunity to receive a bill credit for reducing energy consumption during a peak time rebate event following a notification from EPE. The program will consist of recruitment of participants, implementing and processing the rebates through the billing process, and evaluating the results.

Q138. HOW WILL THE BILL CREDIT BE CALCULATED?

A. The bill credit will be calculated by comparing a customer's actual electricity usage during a Peak Time Rebate ("PTR") event to their baseline usage, which reflects their typical consumption on similar non-PTR event days. The customer will earn a bill credit based on the difference between their baseline usage and their usage over the event, multiplied by the credit rate per kilowatt-hour. Refer to Figure MC-3 below, which shows a simple example of the electricity price drop from 7 cents per kWh to 5 cents per kWh in the afternoon hours due to the PTR credit.

Q139. DESCRIBE WHAT A PTR EVENT IS.

A. A PTR event is a designated period when customer demand for electricity is expected to be high and system conditions more constrained. During these events, participating customers will be notified by EPE in advance and given the opportunity to voluntarily reduce their energy usage compared to their typical consumption. If a customer reduces usage below their baseline during the event window, they will earn a bill credit based on the avoided cost of energy described

below. PTR events can be a useful tool in helping the Company manage system demand, improve reliability, and lower costs for all customers by reducing the need for higher cost generation during peak periods.

Q140. HOW MANY EVENTS WOULD EPE EXPECT TO DECLARE DURING THE FOUR SUMMER MONTHS?

A. EPE would limit called events to a maximum of 20 for the summer period, or an average of 5 per month, with a duration of the designated peak hours described below.

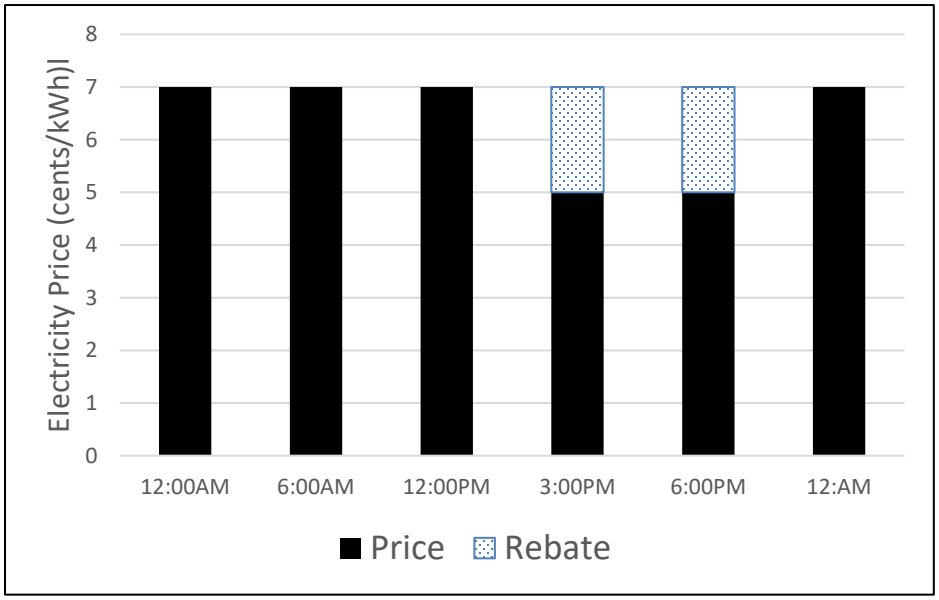
Q141. WHAT ARE THE DESIGNATED PEAK HOURS DURING WHICH A PTR EVENT CAN OCCUR?

A. A PTR event will be a four-consecutive-hour window beginning at 3:00 PM and ending at 7:00 PM.

Q142. WILL THE PARTICIPATING CUSTOMER BE PENALIZED IF THEY FAIL TO REDUCE THEIR USAGE OR EVEN INCREASE USAGE DURING THE EVENT PERIOD?

A. No. Participating customers who do not reduce their usage below their baseline during event periods will not receive any credit for the event but will not be penalized.

Figure MC-3 Peak Time Rebate



Q143. WHAT IS THE BASIS FOR THE REBATE RATE FOR THE PTR?

A. For the pilot program, the basis for the rebate rate (described as the PTR Credit in the proposed rate schedule) will be EPE's avoided cost of energy, filed for the month that the event occurred in, pursuant to the On-Peak Rate monthly energy payment calculated under EPE's Rate No. 16.

Q144. HOW WILL EPE RECOVER THE AMOUNT OF REBATES PROVIDED TO PARTICIPATING CUSTOMERS AND THE COST OF ADMINISTERING THE PROGRAM?

A. The amount of the rebates provided to participating customers will be included in

the determination of EPE's monthly fuel charge, as it will be recorded as cost of fuel and purchased power. EPE intends to track the costs of administering the Peak Time Rebate Pilot. Accordingly, EPE is requesting authorization to establish an accounting order that would allow the Company to track and defer the administrative costs associated with the PTR pilot for future recovery. This approach helps ensure proper and transparent tracking of program-related costs and supports the Commission's objective of encouraging greater customer participation in demand response programs.

Q145. HOW LONG DOES EPE INTEND TO PILOT THIS PROGRAM?

A. The program must encompass an entire summer period, June through September, within a calendar year. Several months of preparation for implementation of the business processes, including modifying the billing system, will be required. The evaluation of the results will entail several months as well. EPE requests approval of a two-year pilot program.

Q146. WHAT IS THE OBJECTIVE OF THIS PILOT PROGRAM?

A. The PTR Pilot Program is designed to evaluate program design, customer engagement, and customer load response under a variety of conditions. The program is not intended to produce large scale behavioral changes in its initial phase. Instead, the pilot will allow EPE to gather data, assess customer awareness

and participation, and refine the program structure based on observed results. In addition, the pilot will provide EPE with valuable information regarding the potential costs to design and implement and administer a larger scale version of the program in the future.

Q147. HAS EPE PROPOSED A RATE SCHEDULE AND INCLUDED IT IN THE ADVICE NOTICE?

A. Yes. EPE is proposing Rate No. 52 – Peak Time Rebate Pilot. Exhibit MC-13 is a copy of the Rate No. 52 rate schedule that is included in the advice notice.

Q148. PLEASE DESCRIBE RATE NO. 52 – PEAK TIME REBATE PILOT.

A. Rate No. 52 provides the provisions through which EPE will compensate participating Residential Service customers for making real-time adjustments to their normal energy usage. The most notable provisions include: 1) Applicability, which provides the following qualifying criteria: service must be provided under Rate No. 01 – Residential Service as a non-DG customer; an AMS meter must be installed, and the customer must be enrolled under Rate No. 52 from May through October consecutively (this is to capture the summer period of June through September), 2) Monthly Rates, which indicates the PTR Credit is the Company's avoided energy cost, as discussed above, and the on-peak period definition when the PTR event is in effect, and 3) Terms and Conditions, which provides the

definitions and details of what a PTR event entails, also described above.

IX. SUMMARY AND CONCLUSION

Q149. PLEASE SUMMARIZE YOUR TESTIMONY.

A. The proposed rates, which I support in my testimony, are set to recover each rate class's allocated revenue requirement as determined by EPE's CCOS. The proposed rates will provide customers with an improved pricing structure that better reflects the differences and variations in electricity costs throughout the year, therefore providing more accurate and effective price signals. The changes to EPE's pricing structures proposed in this case will allow customers to make economic decisions about their electric usage based on rates that more accurately reflect the underlying costs and that will provide economic incentives to conserve energy and potentially improve the utilization and load factor of EPE's electric system. Additionally, I discussed EPE's more significant proposals to revise the language of its rate schedules.

In my testimony, I also present EPE's request for approval of the Large Load tariffs schedules. The tariff schedules prepare EPE to serve large load facilities but with tariffed provisions to assure no cost shifting to EPE's other customers.

Finally, in my testimony I present EPE's request to implement a Peak Time Rebate Pilot Program. This program is intended to gauge the interest of customers

in a rate option that could provide benefit in the form of a bill credit for reduction of load during times that EPE's system is experiencing high levels of demand.

Q150. ARE THE RATE LEVELS AND STRUCTURES PROPOSED BY EPE FAIR AND REASONABLY EXPECTED TO ACCOMPLISH EPE'S GOALS?

A. Yes. EPE has proposed rate structures designed to accurately reflect EPE's cost of service, reduce inter-class and intra-class subsidies, and provide customers with accurate price signals in order that they may make economically sound decisions regarding their electrical consumption. The rates proposed reflect EPE's movement toward full cost-based rates and TOD pricing structures and will contribute in the long term to mitigating the expansion of consumption in peak demand periods, which may reduce system costs to the benefit of all customers in the future.

Q151. DOES THIS CONCLUDE YOUR TESTIMONY?

A. Yes, it does.

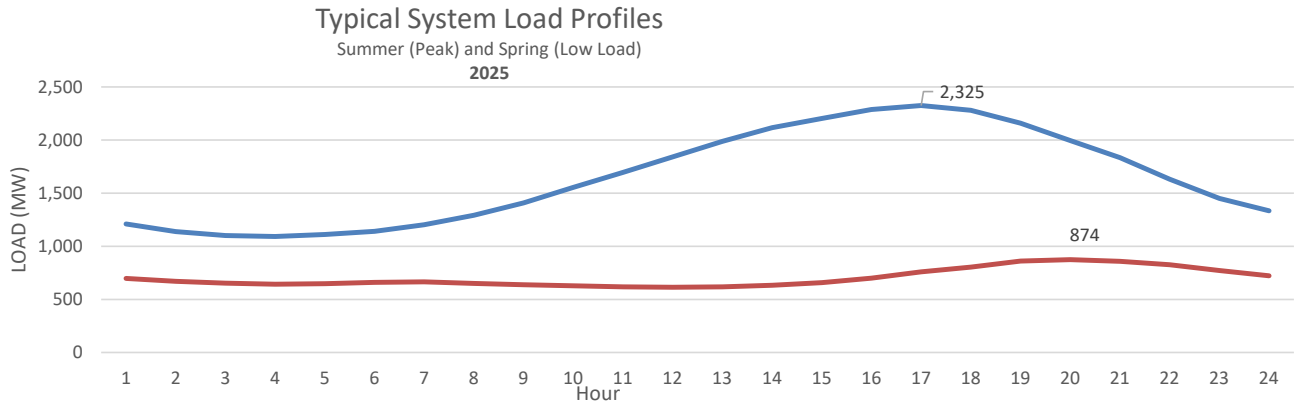
Resource Dispatch

WE ARE TRANSFORMING
THE ENERGY LANDSCAPE

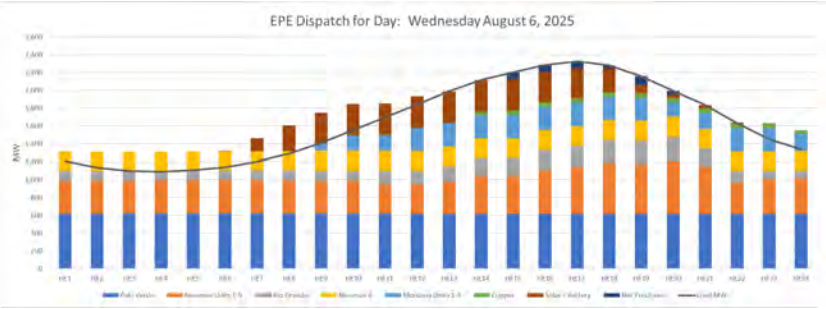
Typical System Load Profiles

Summer (Peak) and Spring (Low Load)



2025 Summer Peak Day Loads & Resources

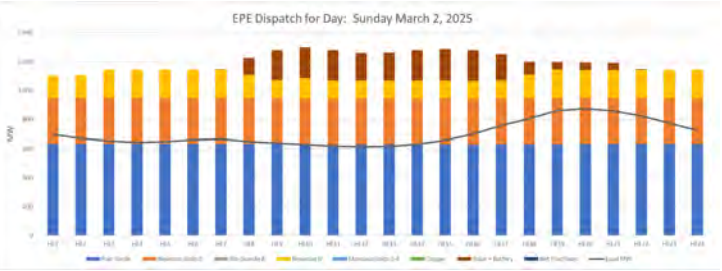
	2025 Annual Peak Demand Day *Wed, 8/06*	
Peak Hour:	*4-6 PM*	*Comments:*
Peak Load	**2,325**	
Contingency Reserves	139	
Spin Purchases	0	
Total Obligations:	**2,464**	
Resources:		
PV Unit 1 (211 MW)	206	
PV Unit 2 (211 MW)	206	
PV Unit 3 (211 MW)	206	
Total Remote Generation:	618	
NM-1 (84 MW)	0	Planned Outaage
NM-2 (80 MW)	65	Derated to 65
NM-3 (105 MW)	89	
NM-4 (230 MW)	200	
NM-5 (282 MW)	197	Unit Derated to 197
NM-6 (230 MW)	225	
RG-6 (50 MW)	0	Forced Outage
RG-7 (50 MW)	39	
RG-8 (150 MW)	139	
RG-9 (95 MW)	88	
Copper (70 MW)	50	Derated to 50 MW
Montana 1 (95 MW)	88	
Montana 2 (95 MW)	88	
Montana 3 (95 MW)	88	Non Spin
Montana 4 (95 MW)	88	
Solar Generation (~560 MW)	339	
Total Local Generation:	1,783	
System Purchases	133	Includes EIM imports and losses
System Sales	40	Includes 40 MW NM Portion of PV3 Sales
Total Resources:	**2,494**	
Position:	**30**	



- 2,325 Peak Demand in 2025
- Approx. 6% of Peak Load for Reserves
- 339 MW in solar generation
- Newman 2, Newman 5 and Copper derated for the day.
- Rio Grande 6 in Forced outage
- Newman 1 in Planned Outage

2025 Low Load Day Loads & Resources

	2025 Annual Low Demand Day *Sun, 3/02*	
Peak Hour:	*7-9 PM*	*Comments:*
Peak Load	**874**	
Contingency Reserves	67	
Spin Purchases	0	
Total Obligations:	**941**	
Resources:		
PV Unit 1 (211 MW)	211	
PV Unit 2 (211 MW)	210	
PV Unit 3 (211 MW)	210	
Total Remote Generation:	631	
NM-1 (84 MW)	0	Forced Outage
NM-2 (80 MW)	0	Forced Outage
NM-3 (105 MW)	81	
NM-4 (230 MW)	0	Planned Outage Summer Prep
NM-5 (282 MW)	195	
NM-6 (230 MW)	220	
RG-6 (50 MW)	0	Maintenance Outage
RG-7 (50 MW)	0	Maintenance Outage
RG-8 (150 MW)	0	Planned Outage Summer Prep
RG-9 (95 MW)	0	Reserve
Copper (70 MW)	0	Planned Outage Summer Prep
Montana 1 (95 MW)	88	
Montana 2 (95 MW)	88	Non Spin
Montana 3 (95 MW)	0	Available for dispatch
Montana 4 (95 MW)	88	
Solar Generation (~560 MW)	50	Battery Discharge
Total Local Generation:	810	
System Purchases	0	No EIM imports
System Sales	390	Includes 40 MW NM Portion of PV3 Sales
Total Resources:	**1,051**	
Position:	**110**	



- 874 Peak Demand in 2025
- Approx. 7.5% of Peak Load for Reserves
- March 2nd is considered a low load day
- Montana 1-4 were available for dispatch
- Solar Generation due to battery discharge
- No purchases needed to serve load

EL PASO ELECTRIC COMPANY

ORIGINAL RATE NO. 50

HIGH LOAD FACTOR POWER SERVICE RATE

APPLICABILITY

Service under this rate schedule shall be limited to Customers whose Maximum Demand, during the current month and previous eleven (11) month period, equaled or exceeded thirty thousand (30,000) kilowatts (kW) and whose average monthly load factor equaled or exceeded eighty-five percent (85%). For new Customers, initial applicability and monthly billing under this rate schedule are subject to expected Load Ramp Period requirements as established in an Energy Service Agreement.

TERRITORY

Areas served by the Company in Doña Ana, Sierra, Otero and Luna Counties.

TYPE OF SERVICE

Service available under this rate schedule will be determined by the Company and will be three phase transmission voltage. All service will be taken at the single point of delivery into a customer-dedicated substation, which substation may be owned by the Company or the Customer. Electric energy will be measured by a meter or meters, or other measuring devices, of each kind needed based on the designated point or points of delivery.

"Energy Service Agreement" or "ESA" is defined as the executed written service agreement entered into by the Customer and the Company in accordance with this rate schedule.

"Contract Capacity" is defined as the Customer specified monthly post-Load Ramp Period peak load requirements for each month as set forth in the ESA.

"Load Ramp Contract Capacity" is defined as the mutually agreed monthly peak load requirements defined in the ESA associated with the Load Ramp Period.

"Load Ramp Period" is defined as the time between commencement of retail service until the customer reaches full Contract Capacity. The ESA must require that the Load Ramp Period cannot exceed 4 years.

MONTHLY RATES

Customer Charge (per meter per month)		$3,791.40
	Summer	**Non-Summer**

Advice Notice No. 317

Signature/Title */s/ James Schichtl*
James Schichtl
Vice President – Customer and Regulatory Solutions

EL PASO ELECTRIC COMPANY

ORIGINAL RATE NO. 50

HIGH LOAD FACTOR POWER SERVICE RATE

Demand Charge per Billing kW		
On-Peak Period	$19.83	---
Off-Peak Period	$16.30	$11.00
Energy Charge per kWh		
On-Peak Period	$0.15178	---
Off-Peak Period	$0.01260	$0.01260

The Summer period shall be the months of June through September. The Non-Summer period shall be all other months. The On-Peak Period shall be from 3:00 P.M. to 7:00 P.M., Mountain Daylight Time, Monday through Friday, for the Summer months. There is no On-Peak Period for the Non-Summer months. The Off-Peak Period shall be all other hours not covered in the On-Peak Period.

MONTHLY MINIMUM CHARGE

The Monthly Minimum Charge is the Customer Charge plus Demand Charge, Other Non-Consumption Based Applicable Riders, Tax Adjustment, plus any applicable Facility Charge.

DETERMINATION OF BILLING DEMAND

Maximum Demand is defined as the highest measured thirty (30) minute interval kW load during the billing month.

The billing demand (in kW) will be the highest of:

(a) the Maximum Demand occurring in the On-Peak Period; or
(b) the Maximum Demand occurring in the Off-Peak Period; or
(c) 80% of the Contract Capacity; or
(d) the demand ratchet of 80% of the Maximum Demand established during the billing months of June through September in the preceding twelve (12) month period; or
(e) 30,000 kW.

Customer will have no more time than the Load Ramp Period to reach full Contract Capacity, during which time, (b) above, monthly billing demand shall not be less than 80% of the customer's Load Ramp Contract Capacity rather than 80% of the Contract Capacity.

The billing demands under (c) through (e), will be prorated based on number of hours in the On-Peak Period and in the Off-Peak Period during the billing month.

Advice Notice No. 317

Signature/Title */s/ James Schichtl*
James Schichtl
Vice President – Customer and Regulatory Solutions

EL PASO ELECTRIC COMPANY

ORIGINAL RATE NO. 50

HIGH LOAD FACTOR POWER SERVICE RATE

POWER FACTOR ADJUSTMENT

If the power factor at the time of Maximum Demand is below 90% lagging, a power factor adjustment shall be calculated as follows:

ADJ = ((kW x .95 / PF) – kW) x DC, where
ADJ = Increase to applicable Demand Charge,
kW = Maximum Demand,
PF = Monthly measured Power Factor, and
DC = Demand Charge.

FUEL AND PURCHASED POWER COST ADJUSTMENT CLAUSE (FPPCAC)

All service taken under this rate schedule is subject to the provisions of the Company's Rate No. 18 (FPPCAC).

OTHER APPLICABLE RIDERS

All service taken under this rate schedule is subject to the provisions of other Company riders that may apply to this rate schedule and shall be billed pursuant to provisions of those riders.

TAX ADJUSTMENT

Billings under this rate schedule may be increased by an amount equal to the sum of taxes payable under the Gross Receipts and Compensating Tax Act and of all other taxes, fees or charges (exclusive of ad valorem, state and federal income taxes) payable by the utility and levied or assessed by any governmental authority on the public utility service rendered, or on the right or privilege of rendering the service, or on any object or event incidental to the rendition of the service.

CONTRACT FOR SERVICE

An Energy Service Agreement, and any associated addenda, must be executed between the Company and the Customer which shall be filed by the Company with the New Mexico Public Regulation Commission prior to taking service under this rate schedule. The ESA shall include, among other things, the following provisions:

Advice Notice No. 317

Signature/Title */s/ James Schichtl*
James Schichtl
Vice President – Customer and Regulatory Solutions

EL PASO ELECTRIC COMPANY

ORIGINAL RATE NO. 50

HIGH LOAD FACTOR POWER SERVICE RATE

Initial Term Minimum: Twenty (20) year minimum initial term, with automatic annual renewal after the Initial Term, as further provided in the ESA. The Load Ramp Period is included in the Initial Term Minimum.

Security: If the Customer executing the Energy Service Agreement has at least two of the following three ratings (i) an Issuer Credit Rating of at least "A-" from Standard and Poor's (S&P), (ii) an Issuer Rating of at least "A3" from Moody's Investor Service (Moody's), or (iii) a Long-Term Issuer Default Rating of at least "A-" from Fitch Ratings (Fitch), then financial security will not be required. If financial security is required, it shall be provided in a form acceptable to the Company, in an amount and subject to other terms specified in the Energy Service Agreement and may be modified annually, as set forth below. The Security Amount must be provided in one or more of the following forms:

(1) Post of cash or cash equivalents.
(2) An irrevocable standby letter of credit ("Letter of Credit") issued by a U.S. bank or the U.S. branch of a foreign bank, which is not affiliated with the customer, with an Issuer Credit Rating of at least "A-" from S&P or an Issuer Rating of at least "A3" from Moody's. Such security must be issued for a minimum term of 365 days. The Customer must cause the renewal or extension of the security for additional consecutive terms of 365 days or more no later than 30 days prior to each expiration date of the security. If the security is not renewed or extended as required herein, the Company will have the right to draw immediately upon the Letter of Credit and be entitled to hold the amounts drawn as security.
(3) An irrevocable and unconditional guarantee from the ultimate parent or a corporate affiliate of the Customer (the "Guarantor"), so long as the Guarantor has (a) at least two of the following three ratings (i) an Issuer Credit Rating of at least A- from S&P, (ii) an Issuer Rating of at least A3 from Moody's, or (iii) a Long-Term Issuer Default Rating of at least "A-" from Fitch, or (b) is approved by EPE in its reasonable discretion.

If such requirements are no longer met, then Customer must provide replacement security in an acceptable form, as specified above, within 30 days or the Customer may enter into an event of default, as outlined in the ESA.

Initial Security Amount: If financial security is required pursuant to the above, then the Company and Customer will agree on an Initial Security Amount to be included in the Energy Service Agreement and such amount is subject to change annually, as described below. The Initial Security Amount shall reflect the initial incremental investment exposure of the

EL PASO ELECTRIC COMPANY

ORIGINAL RATE NO. 50

HIGH LOAD FACTOR POWER SERVICE RATE

Company prior to the Annual Security Adjustment, Customer's Estimated Load Forecast, Customer's cash contributions for Facilities, and other Customer characteristics as necessary.

Security provided by the Customer shall be calculated on a dollar per MW basis of the requested maximum Monthly Contract Demand over the Initial Term and included in the Energy Service Agreement.

Annual Security Adjustment: On an annual basis the Security Amount will be adjusted (the "Adjusted Security Amount") by Company based on the Customer Estimated Load Forecast and the Company's projected incremental cost of resources necessary for service of Customer for the remainder of the Initial Term or any renewal thereof. Prior to the execution of any procurement agreements, the Company will provide Customer the estimated cost of, and annual revenue requirement for, incremental new generation assets and incremental new transmission assets, and the Customer's allocated share of the annual revenue requirement consistent with the most recent Commission-approved cost of service study, adjusted for other executed Energy Service Agreements under this Tariff not yet included in the cost of service study. The Adjusted Security Amount will be equal to the net present value, using a discount rate equal to Company's weighted average cost of capital approved by the New Mexico Public Regulation Commission at the time of the calculation, of the sum of the allocated annual revenue requirements for the remainder of the Initial Term or any renewal thereof. The Company will provide Customer with all inputs and assumptions. The Customer will have no less than 90 days to review the inputs, assumptions, and calculations. In the event of an error or disagreement, the Company and Customer will work together in good faith to resolve such error or disagreement.

Termination for Default: Customers terminating service under this rate schedule or engaging in any, as the result of an event of default under the terms of the Energy Service Agreement or this rate schedule prior to the end of the Initial Term or any renewal thereof may be subject to damages or other exit fees as set forth in the Energy Services Agreement.

Termination for Default: Customers terminating service, as the result of an Event of Default under the terms of the Energy Service Agreement or this rate schedule prior to the end of the Initial Term may be subject to damages as set forth in the Energy Services Agreement.

FACILITY CHARGE

Customer-dedicated Facility Cost Recovery ("Facility Charge): A Facility Charge shall be based on the actual customer-dedicated facility costs incurred by the Company on behalf of the

Advice Notice No. 317

EL PASO ELECTRIC COMPANY

ORIGINAL RATE NO. 50

HIGH LOAD FACTOR POWER SERVICE RATE

Customer and provide for full recovery of such costs and the associated operating and maintenance costs of the facility, as defined in the ESA. The amount and duration of the Facility Charge shall be determined by separate agreement between the Company and the Customer and included in the ESA.

TERMS OF PAYMENT

All bills under this rate schedule are due and payable when rendered and become delinquent twenty (20) calendar days thereafter. If the twentieth day falls on a holiday or weekend, the next Company business day will apply.

TERMS AND CONDITIONS

Service supplied under this rate schedule is subject to the Company's Rules and Regulations on file with the New Mexico Public Regulation Commission and available for inspection at Company offices.

The Customer and the Company will determine whether a new Customer qualifies for this rate schedule.

If the Customer's Maximum Demand falls below 30,000 kW in the current month and previous month after the Load Ramp Period, the Customer shall no longer be eligible for service under this rate schedule and shall be placed on Rate No. 04 – General Service Rate or Rate No. 09 – Large Power Service or Rate No. 51 – Large Load Power Service Rate, as applicable, starting with the following billing month. After a minimum of twelve (12) months on the applicable rate schedule, should the Customer's Maximum Demand equal or exceed 30,000 kW in any two (2) consecutive months thereafter, the Customer shall be returned to Rate No. 50 – High Load Factor Power Service. The provisions of the ESA will continue to apply regardless of rate schedule that Customer is placed under.

If the Customer’s average monthly load factor falls below 85% in the current month and previous month after the Load Ramp Period, the Customer shall no longer be eligible for service under this rate schedule and shall be placed on Rate No. 51 – Large Load Power Service starting with the following billing month. After a minimum of twelve (12) months on Rate No. 51 – Large Load Power Service, should the Customer's average monthly load factor equal or exceed 85% in any two (2) consecutive months thereafter, the Customer shall be returned to Rate No. 50 – High Load Factor Power Service.

EL PASO ELECTRIC COMPANY

ORIGINAL RATE NO. 50

HIGH LOAD FACTOR POWER SERVICE RATE

Any new Customer that has not established a prior service history with the Company shall be classified under the appropriate rate schedule in accordance with a demand estimate performed by the Company.

PRORATION ADJUSTMENTS

Charges for service supplied under this rate schedule, except the Customer Charge, are subject to proration adjustments.

Advice Notice No. 317

Signature/Title */s/ James Schichtl*
James Schichtl
Vice President – Customer and Regulatory Solutions

EL PASO ELECTRIC COMPANY

ORIGINAL RATE NO. 51

LARGE LOAD POWER SERVICE RATE

APPLICABILITY

Service under this rate schedule shall be limited to Customers whose Maximum Demand, during the current month and previous eleven (11) month period, equaled or exceeded ten thousand (10,000) kilowatts (kW). For new Customers, initial applicability and monthly billing under this rate schedule are subject to expected Load Ramp Period requirements as established in an Energy Service Agreement.

TERRITORY

Areas served by the Company in Doña Ana, Sierra, Otero and Luna Counties.

TYPE OF SERVICE

Service available under this rate schedule will be determined by the Company and will be three phase transmission voltage. All service will be taken at the single point of delivery into a customer-dedicated substation, which substation may be owned by the Company or the Customer. Electric energy will be measured by a meter or meters, or other measuring devices, of each kind needed based on the designated point or points of delivery.

"Energy Service Agreement" or "ESA" is defined as the executed written service agreement entered into by the Customer and the Company in accordance with this rate schedule.

"Contract Capacity" is defined as the Customer specified monthly post-Load Ramp Period peak load requirements for each month as set forth in the ESA.

"Load Ramp Contract Capacity" is defined as the mutually agreed monthly peak load requirements defined in the ESA associated with the Load Ramp Period.

"Load Ramp Period" is defined as the time between commencement of retail service until the customer reaches full Contract Capacity. The ESA must require that the Load Ramp Period cannot exceed 4 years.

MONTHLY RATES

Customer Charge (per meter per month)	$1,320.89

	Summer	Non-Summer
Demand Charge per Billing kW		

Advice Notice No. 317

Signature/Title */s/ James Schichtl*
James Schichtl
Vice President – Customer and Regulatory Solutions

EL PASO ELECTRIC COMPANY

ORIGINAL RATE NO. 51

LARGE LOAD POWER SERVICE RATE

On-Peak Period	$28.60	---
Off-Peak Period	$25.23	$6.22
Energy Charge per kWh		
On-Peak Period	$0.24160	---
Off-Peak Period	$0.01412	$0.01412

The Summer period shall be the months of June through September. The Non-Summer period shall be all other months. The On-Peak Period shall be from 3:00 P.M. to 7:00 P.M., Mountain Daylight Time, Monday through Friday, for the Summer months. There is no On-Peak Period for the Non-Summer months. The Off-Peak Period shall be all other hours not covered in the On-Peak Period.

MONTHLY MINIMUM CHARGE

The Monthly Minimum Charge is the Customer Charge plus Demand Charge, Other Non-Consumption Based Applicable Riders, Tax Adjustment, plus any applicable Facility Charge.

DETERMINATION OF BILLING DEMAND

Maximum Demand is defined as the highest measured thirty (30) minute interval kW load during the billing month.

The billing demand (in kW) will be the highest of:

(a) the Maximum Demand occurring in the On-Peak Period; or
(b) the Maximum Demand occurring in the Off-Peak Period; or
(c) 80% of the Contract Capacity; or
(d) the demand ratchet of 80% of the Maximum Demand established during the billing months of June through September in the preceding twelve (12) month period; or
(e) 10,000 kW.

Customer will have no more time than the Load Ramp Period to reach full Contract Capacity, during which time, (b) above, monthly billing demand shall not be less than 80% of the customer's Load Ramp Contract Capacity rather than 80% of the Contract Capacity.

The billing demands under (c) through (e), will be prorated based on number of hours in the On-Peak Period and in the Off-Peak Period during the billing month.

Advice Notice No. 317

EL PASO ELECTRIC COMPANY

ORIGINAL RATE NO. 51

LARGE LOAD POWER SERVICE RATE

POWER FACTOR ADJUSTMENT

If the power factor at the time of Maximum Demand is below 90% lagging, a power factor adjustment shall be calculated as follows:

ADJ = ((kW x .95 / PF) – kW) x DC, where
ADJ = Increase to applicable Demand Charge,
kW = Maximum Demand,
PF = Monthly measured Power Factor, and
DC = Demand Charge.

FUEL AND PURCHASED POWER COST ADJUSTMENT CLAUSE (FPPCAC)

All service taken under this rate schedule is subject to the provisions of the Company's Rate No. 18 (FPPCAC).

OTHER APPLICABLE RIDERS

All service taken under this rate schedule is subject to the provisions of other Company riders that may apply to this rate schedule and shall be billed pursuant to provisions of those riders.

TAX ADJUSTMENT

Billings under this rate schedule may be increased by an amount equal to the sum of taxes payable under the Gross Receipts and Compensating Tax Act and of all other taxes, fees or charges (exclusive of ad valorem, state and federal income taxes) payable by the utility and levied or assessed by any governmental authority on the public utility service rendered, or on the right or privilege of rendering the service, or on any object or event incidental to the rendition of the service.

CONTRACT FOR SERVICE

An Energy Service Agreement, and any associated addenda, must be executed between the Company and the Customer which shall be filed by the Company with the New Mexico Public Regulation Commission prior to taking service under this rate schedule. The ESA shall include, among other things, the following provisions:

Advice Notice No. **317**

Signature/Title */s/ James Schichtl*
James Schichtl
Vice President – Customer and Regulatory Solutions

EL PASO ELECTRIC COMPANY

ORIGINAL RATE NO. 51

LARGE LOAD POWER SERVICE RATE

Initial Term Minimum: Twenty (20) year minimum initial term, with automatic annual renewal after the Initial Term, as further provided in the ESA. The Load Ramp Period is included in the Initial Term Minimum.

Security: If the Customer executing the Energy Service Agreement has at least two of the following three ratings (i) an Issuer Credit Rating of at least "A-" from Standard and Poor's (S&P), (ii) an Issuer Rating of at least "A3" from Moody's Investor Service (Moody's), or (iii) a Long-Term Issuer Default Rating of at least "A-" from Fitch Ratings (Fitch), then financial security will not be required. If financial security is required, it shall be provided in a form acceptable to the Company, in an amount and subject to other terms specified in the Energy Service Agreement and may be modified annually, as set forth below. The Security Amount must be provided in one or more of the following forms:

(1) Post of cash or cash equivalents.
(2) An irrevocable standby letter of credit ("Letter of Credit") issued by a U.S. bank or the U.S. branch of a foreign bank, which is not affiliated with the customer, with an Issuer Credit Rating of at least "A-" from S&P or an Issuer Rating of at least "A3" from Moody's. Such security must be issued for a minimum term of 365 days. The Customer must cause the renewal or extension of the security for additional consecutive terms of 365 days or more no later than 30 days prior to each expiration date of the security. If the security is not renewed or extended as required herein, the Company will have the right to draw immediately upon the Letter of Credit and be entitled to hold the amounts drawn as security.
(3) An irrevocable and unconditional guarantee from the ultimate parent or a corporate affiliate of the Customer (the "Guarantor"), so long as the Guarantor has (a) at least two of the following three ratings (i) an Issuer Credit Rating of at least A- from S&P, (ii) an Issuer Rating of at least A3 from Moody's, or (iii) a Long-Term Issuer Default Rating of at least "A-" from Fitch, or (b) is approved by EPE in its reasonable discretion.

If such requirements are no longer met, then Customer must provide replacement security in an acceptable form, as specified above, within 30 days or the Customer may enter into an event of default, as outlined in the ESA.

Initial Security Amount: If financial security is required pursuant to the above, then the Company and Customer will agree on an Initial Security Amount to be included in the Energy Service Agreement and such amount is subject to change annually, as described below. The Initial Security Amount shall reflect the initial incremental investment exposure of the

EL PASO ELECTRIC COMPANY

ORIGINAL RATE NO. 51

LARGE LOAD POWER SERVICE RATE

Company prior to the Annual Security Adjustment, Customer's Estimated Load Forecast, Customer's cash contributions for Facilities, and other Customer characteristics as necessary.

Security provided by the Customer shall be calculated on a dollar per MW basis of the requested maximum Monthly Contract Demand over the Initial Term and included in the Energy Service Agreement.

Annual Security Adjustment: On an annual basis the Security Amount will be adjusted (the "Adjusted Security Amount") by Company based on the Customer Estimated Load Forecast and the Company's projected incremental cost of resources necessary for service of Customer for the remainder of the Initial Term or any renewal thereof. Prior to the execution of any procurement agreements, the Company will provide Customer the estimated cost of, and annual revenue requirement for, incremental new generation assets and incremental new transmission assets, and the Customer's allocated share of the annual revenue requirement consistent with the most recent Commission-approved cost of service study, adjusted for other executed Energy Service Agreements under this Tariff not yet included in the cost of service study. The Adjusted Security Amount will be equal to the net present value, using a discount rate equal to Company's weighted average cost of capital approved by the New Mexico Public Regulation Commission at the time of the calculation, of the sum of the allocated annual revenue requirements for the remainder of the Initial Term or any renewal thereof. The Company will provide Customer with all inputs and assumptions. The Customer will have no less than 90 days to review the inputs, assumptions, and calculations. In the event of an error or disagreement, the Company and Customer will work together in good faith to resolve such error or disagreement.

Termination for Default: Customers terminating service, as the result of an Event of Default under the terms of the Energy Service Agreement or this rate schedule prior to the end of the Initial Term may be subject to damages as set forth in the Energy Services Agreement.

FACILITY CHARGE

Customer-dedicated Facility Cost Recovery ("Facility Charge): A Facility Charge shall be based on the actual customer-dedicated facility costs incurred by the Company on behalf of the Customer and provide for full recovery of such costs and the associated operating and maintenance costs of the facility, as defined in the ESA. The amount and duration of the Facility Charge shall be determined by separate agreement between the Company and the Customer and included in the ESA.

EL PASO ELECTRIC COMPANY

ORIGINAL RATE NO. 52

PEAK TIME REBATE PILOT

APPLICABILITY

This Peak Time Rebate ("PTRP") Credit provided by this rate schedule is applicable to bills for electric service provided under Rate No. 01 Residential Service Rate. Customers must have an existing Advanced Metering System meter installed to participate. To be eligible for a PTRP Credit, the customer must enroll for the consecutive months of May through October ("PTRP Season") during the pilot period and agree to receive PTRP notifications via the preferred communication method listed on the account.

TERRITORY

Areas served by the Company in Doña Ana, Sierra, Otero and Luna Counties.

TYPE OF SERVICE

The reduction in energy use during Company-called PTRP events, relative to each Customer's baseline energy use, as determined by the Company, will be multiplied by the PTRP Credit rate to calculate the incentive credit presented on the monthly bill. Energy usage for all hours will be charged at the applicable Rate No. 01 rate.

MONTHLY RATES

PTRP Credit Rate, per kWh	See EPE's On-Peak Monthly Energy Payment Rate, filed pursuant to §17.9.570.11(B)(1)(a) NMAC, Rate No. 16 Purchased Power Service.

To receive the PTRP Credit, the Customer must reduce energy use during a PTRP Event. Such event will be a four-consecutive-hour window between the hours of 3:00 PM to 7:00 PM. Events will not be called on holidays. Holidays are New Year's Day on January 1; Memorial Day, the last Monday in May; Independence Day on July 4; Labor Day, the first Monday in September; Thanksgiving Day, the fourth Thursday in November; and Christmas Day on December 25. If a holiday falls on a Saturday, the preceding Friday will be designated the holiday. If a holiday falls on a Sunday, the following Monday will be designated the holiday.

Advice Notice No. 317

Vice President – Customer and Regulatory Solutions

EL PASO ELECTRIC COMPANY

ORIGINAL RATE NO. 52

PEAK TIME REBATE PILOT

MONTHLY MINIMUM CHARGE

The PTRP Credit presented on the monthly bill shall be limited so that the Monthly Minimum Charge provision of Schedule No. 01 Residential Service Rate is followed.

TERMS AND CONDITIONS

Service supplied under this rate schedule is subject to the Company's Rules and Regulations on file with the New Mexico Public Regulation Commission and available for inspection at Company offices.

The Company initiates PTRP events with an event notification to participating Customers the day prior to the PTRP event. Participating Customers must choose at least one method for receipt of notification: email, text, or another available option. The Company will not call PTRP events for more than two consecutive days.

The Customer may unsubscribe from the PTRP event notifications at any time after the PTRP Season. If the Customer unsubscribes, they will receive credit only for those events for which they are enrolled and receive notifications.

PRORATION ADJUSTMENTS

Charges for service supplied under this rate schedule are subject to proration adjustments.

Advice Notice No. 317

BEFORE THE NEW MEXICO PUBLIC REGULATION COMMISSION

IN THE MATTER OF THE APPLICATION OF EL PASO ELECTRIC COMPANY FOR REVISION OF ITS RETAIL ELECTRIC RATES PURSUANT TO ADVICE NOTICE NO. 317	)	**Case No. 25-00082-UT**
EL PASO ELECTRIC COMPANY, Applicant.	)	

DECLARATION OF MANUEL CARRASCO IN SUPPORT OF THE FOREGOING DIRECT TESTIMONY TO THE APPLICATION OF EL PASO ELECTRIC COMPANY FOR REVISION OF ITS RETAIL ELECTRIC RATES PURSUANT TO ADVICE NOTICE NO. 317

I, ***Manuel Carrasco***, pursuant to Rule 1-011 NMRA, state as follows:

1. I affirm in writing under penalty of perjury under the laws of the State of New Mexico that the following statements are true and correct.

2. I am over 18 years of age and have personal knowledge of the facts stated herein. I am employed by El Paso Electric Company ("EPE" or "the Company") as the *Manager – Rate Research.*

3. The foregoing Direct Testimony of Manuel Carrasco, together with all exhibits sponsored therein and attached thereto, is true and accurate based on my knowledge and belief.

4. I submit this Declaration, based upon my personal knowledge and upon information and belief, in support of EPE's ***Application for Revision of Its Retail Electric Rates Pursuant to Advice Notice No. 317.***

FURTHER, DECLARANT SAYETH NAUGHT.

I declare under penalty of perjury that the foregoing is true and correct.

Executed on March 27, 2026.

EL PASO ELECTRIC COMPANY
2026 NEW MEXICO RATE CASE FILING
SCHEDULE B-5: ALLOWANCE FOR FUNDS USED DURING
CONSTRUCTION GENERATED AND TRANSFERRED TO PLANT IN SERVICE
SPONSOR: CYNTHIA S. PRIETO
PREPARER: MAGDALENA RODRIGUEZ

FOR THE CALENDAR YEARS 2021, 2022, 2023, 2024 AND THE BASE AND TEST YEAR PERIODS
ENDED SEPTEMBER 30, 2025

Methods, Procedures and Calculations Followed in Capitalizing Allowance for Funds used during Construction.

During the Base Period ended September 30, 2025, the Company used an AFUDC accrual rate of 6.67% for the two months ended November 30, 2024, 6.57% for the month ended December 31, 2024, 6.59% for the three months ended March 31, 2025, 6.31% for the four months ended July 31, 2025 and 6.11% for the two months ended September 30, 2025. The amount of AFUDC is determined by applying an accrual rate to the portion of CWIP not included in rate base by regulatory authorities.

AFUDC is capitalized monthly and is calculated by applying the accrual rate to:

1. Prior month-end balances of the portion of CWIP not included in rate base, plus one-half of the current month's cash expenditures.

The Company is currently determining its AFUDC rate by:

1. Using the components of capital and their cost levels as of the end of the prior year for the long-term debt, preferred stock and common equity balances; the short-term debt balances and related cost and average balances for construction work in progress are estimated for the current year with appropriate adjustments as actual data becomes available, per the formula prescribed by FERC.

Line No.	(1) Period Ended	(2) Annualized Rate	(3) Amount Generated	(4) Amount Transferred to Plant in Service

18	3 ME December 31, 2021	5.07%	2,710,317	494,405
19	9 ME September 30, 2021	5.44%	6,451,084	3,826,996

NOTES:

General Information Regarding AFUDC:

1. AFUDC is charged to all generation, distribution and transmission construction work in progress workorders. General acquisition (office furniture, transportation equipment, etc.) workorders are excluded from receiving AFUDC charges.
2. The AFUDC rate is applied to the previous month's cash balance plus one-half of the current month's cash expenditures for each eligible work order.
3. All eligible construction is charged at the same rate.
4. AFUDC is compounded semi-annually.
5. The Base Period and Test Year Period data are the same because the Company is using a Historical Test Year Period and no adjustments are necessary.

Notes:

(A) Account 120.1 through 120.4 are excluded from this schedule because nuclear fuel is financed through the Rio Grande Resources Trust and consolidated in EPE's financial statements. Nuclear Fuel under capital leases is recorded in FERC account 120.6 and the related amortization is recorded in account 120.5, along with related financing costs. All nuclear fuel costs are for the operation of the Palo Verde Nuclear Generating Station. EPE does not include nuclear fuel in rate base.

Amounts may not add or tie to other schedules due to rounding.

Attention Cynthia S. Prieto
Vice President - Controller

Ladies and Gentlemen:

Pursuant to your request, we have conducted a depreciation study related to the electric plant of El Paso Electric Company as of June 30, 2025. The attached report presents a description of the methods used in the estimation of depreciation, the summary of annual depreciation accrual rates, the statistical support for the service life and net salvage estimates and the detailed tabulations of annual depreciation.

We gratefully acknowledge the assistance of El Paso Electric personnel in the conduct of this study.

Respectfully submitted,

GANNETT FLEMING VALUATION

EL PASO ELECTRIC COMPANY
DEPRECIATION STUDY
EXECUTIVE SUMMARY

Pursuant to El Paso Electric Company's ("El Paso" or "Company") request, Gannett Fleming Valuation and Rate Consultants, LLC ("Gannett Fleming") conducted a depreciation study related to the electric plant as of June 30, 2025. The purpose of this study was to determine the annual depreciation accrual rates and amounts for book and ratemaking purposes.

The depreciation rates are based on the straight line method using the average service life ("ASL") procedure and were applied on a remaining life basis. The calculations were based on attained ages and estimated average service life, and net salvage characteristics for each depreciable group of assets.

El Paso's accounting policy has not changed since the last depreciation study was prepared. However, there has been change in expected life spans of generating facilities, recording retirements of assets as well as the associated cost of removal and gross salvage. These changes have caused the proposed depreciation rates in the depreciation study to change from those currently-approved from the last depreciation study as of December 31, 2019.

Gannett Fleming recommends the calculated annual depreciation accrual rates set forth herein apply specifically to electric plant in service as of June 30, 2025 as summarized by Table 1 of the study. Supporting analysis and calculations are provided within the study.

The study results set forth an annual depreciation expense of $150.2 million when applied to depreciable plant balances as of June 30, 2025. The results are summarized at the functional level as follows:

SUMMARY OF ORIGINAL COST, ACCRUAL RATES AND AMOUNTS

FUNCTION	ORIGINAL COST AS OF JUNE 30, 2025	PROPOSED RATE	PROPOSED EXPENSE
Steam Production Plant	$765,032,283.77	6.15	$47,033,879
Solar Production Plant	1,517,692.12	3.37	51,185
Gas Turbine Plant	601,728,933.87	4.91	29,515,540
Transmission Plant	762,294,706.38	1.73	13,166,041
Distribution Plant	2,046,799,670.24	2.41	49,402,917
Battery Storage Plant	2,162,780.21	7.04	152,258
General Plant	272,473,740.15	3.98	10,844,341
Total	**$4,452,009,806.74**	**3.37**	**$150,166,161**

PART I. INTRODUCTION

EL PASO ELECTRIC COMPANY
DEPRECIATION STUDY

PART I. INTRODUCTION

SCOPE

This report sets forth the results of the depreciation study for El Paso Electric Company ("El Paso"), to determine the annual depreciation accrual rates and amounts for book purposes applicable to the original cost of electric plant as of June 30, 2025. The rates and amounts are based on the straight line remaining life method of depreciation. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates related to electric plant in service as of June 30, 2025.

The service life and net salvage estimates resulting from the study were based on informed judgment which incorporated analyses of historical plant retirement data as recorded through 2023, a review of Company practice and outlook as they relate to plant operation and retirement, and consideration of current practice in the electric industry, including knowledge of service lives and net salvage estimates used for other electric companies.

PLAN OF REPORT

Part I, Introduction, contains statements with respect to the plan of the report, and the basis of the study. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and the methods used in the service life and net salvage studies. Part III, Service Life Considerations, presents the factors and judgment utilized in the average service life analysis. Part IV, Net Salvage Considerations, presents the judgment utilized for the net salvage study. Part V, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation.

Part VI, Results of Study, presents summaries by depreciable group of annual depreciation accrual rates and amounts, as well as composite remaining lives. Part VII, Service Life Statistics presents the statistical analysis of service life estimates, Part VIII, Net Salvage Statistics sets forth the statistical indications of net salvage percents, and Part IX, Detailed Depreciation Calculations presents the detailed tabulations of annual depreciation.

BASIS OF THE STUDY

Depreciation

Depreciation, in public utility regulation, is the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of utility plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among causes to be given consideration are wear and tear, deterioration, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand, and the requirements of public authorities.

Depreciation, as used in accounting, is a method of distributing fixed capital costs, less net salvage, over a period of time by allocating annual amounts to expense. Each annual amount of such depreciation expense is part of that year's total cost of providing electric utility service. Normally, the period of time over which the fixed capital cost is allocated to the cost of service is equal to the period of time over which an item renders service, that is, the item's service life. The most prevalent method of allocation is to distribute an equal amount of cost to each year of service life. This method is known as the straight line method of depreciation.

For most accounts, the annual depreciation was calculated by the straight line method using the average service life procedure and the remaining life basis. For

certain General Plant accounts, the annual depreciation is based on amortization accounting. Both types of calculations were based on original cost, attained ages, and estimates of service lives and net salvage.

The straight line method, average service life procedure is a commonly used depreciation calculation procedure that has been widely accepted in jurisdictions throughout North America. Gannett Fleming recommends its continued use. Amortization accounting is used for certain General Plant accounts because of the disproportionate plant accounting effort required when compared to the minimal original cost of the large number of items in these accounts. An explanation of the calculation of annual and accrued amortization is presented beginning on page V-4 of the report.

Service Life and Net Salvage Estimates

The service life and net salvage estimates used in the depreciation and amortization calculations were based on informed judgment which incorporated a review of management's plans, policies and outlook, a general knowledge of the electric utility industry, and comparisons of the service life and net salvage estimates from our studies of other electric utilities. The use of survivor curves to reflect the expected dispersion of retirement provides a consistent method of estimating depreciation for electric plant. Iowa type survivor curves were used to depict the estimated survivor curves for the plant accounts not subject to amortization accounting.

The procedure for estimating service lives consisted of compiling historical data for the plant accounts or depreciable groups, analyzing this history through the use of widely accepted techniques, and forecasting the survivor characteristics for each depreciable group on the basis of interpretations of the historical data analyses and the probable future. The combination of the historical experience and the estimated future yielded estimated survivor curves from which the average service lives were derived.

PART II. ESTIMATION OF SURVIVOR CURVES

PART II. ESTIMATION OF SURVIVOR CURVES

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below and the development of net salvage is discussed in later sections of this report.

SURVIVOR CURVES

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

Iowa Type Curves

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

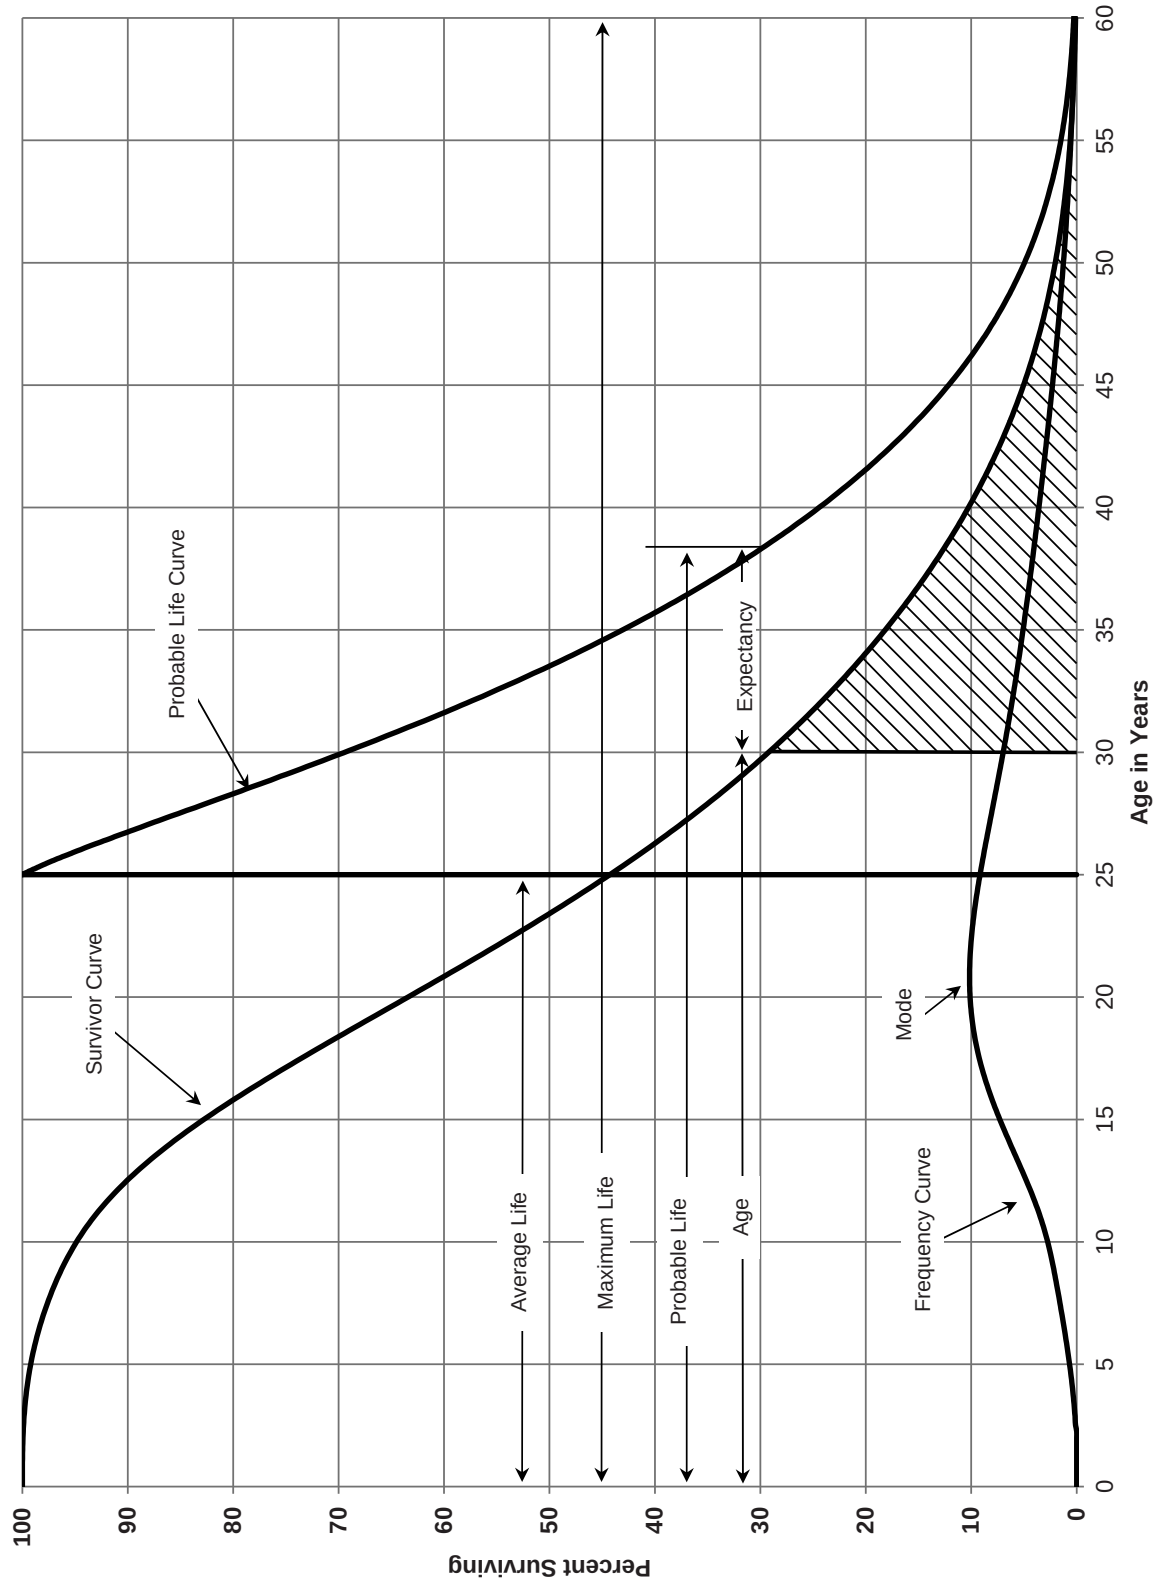

FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES

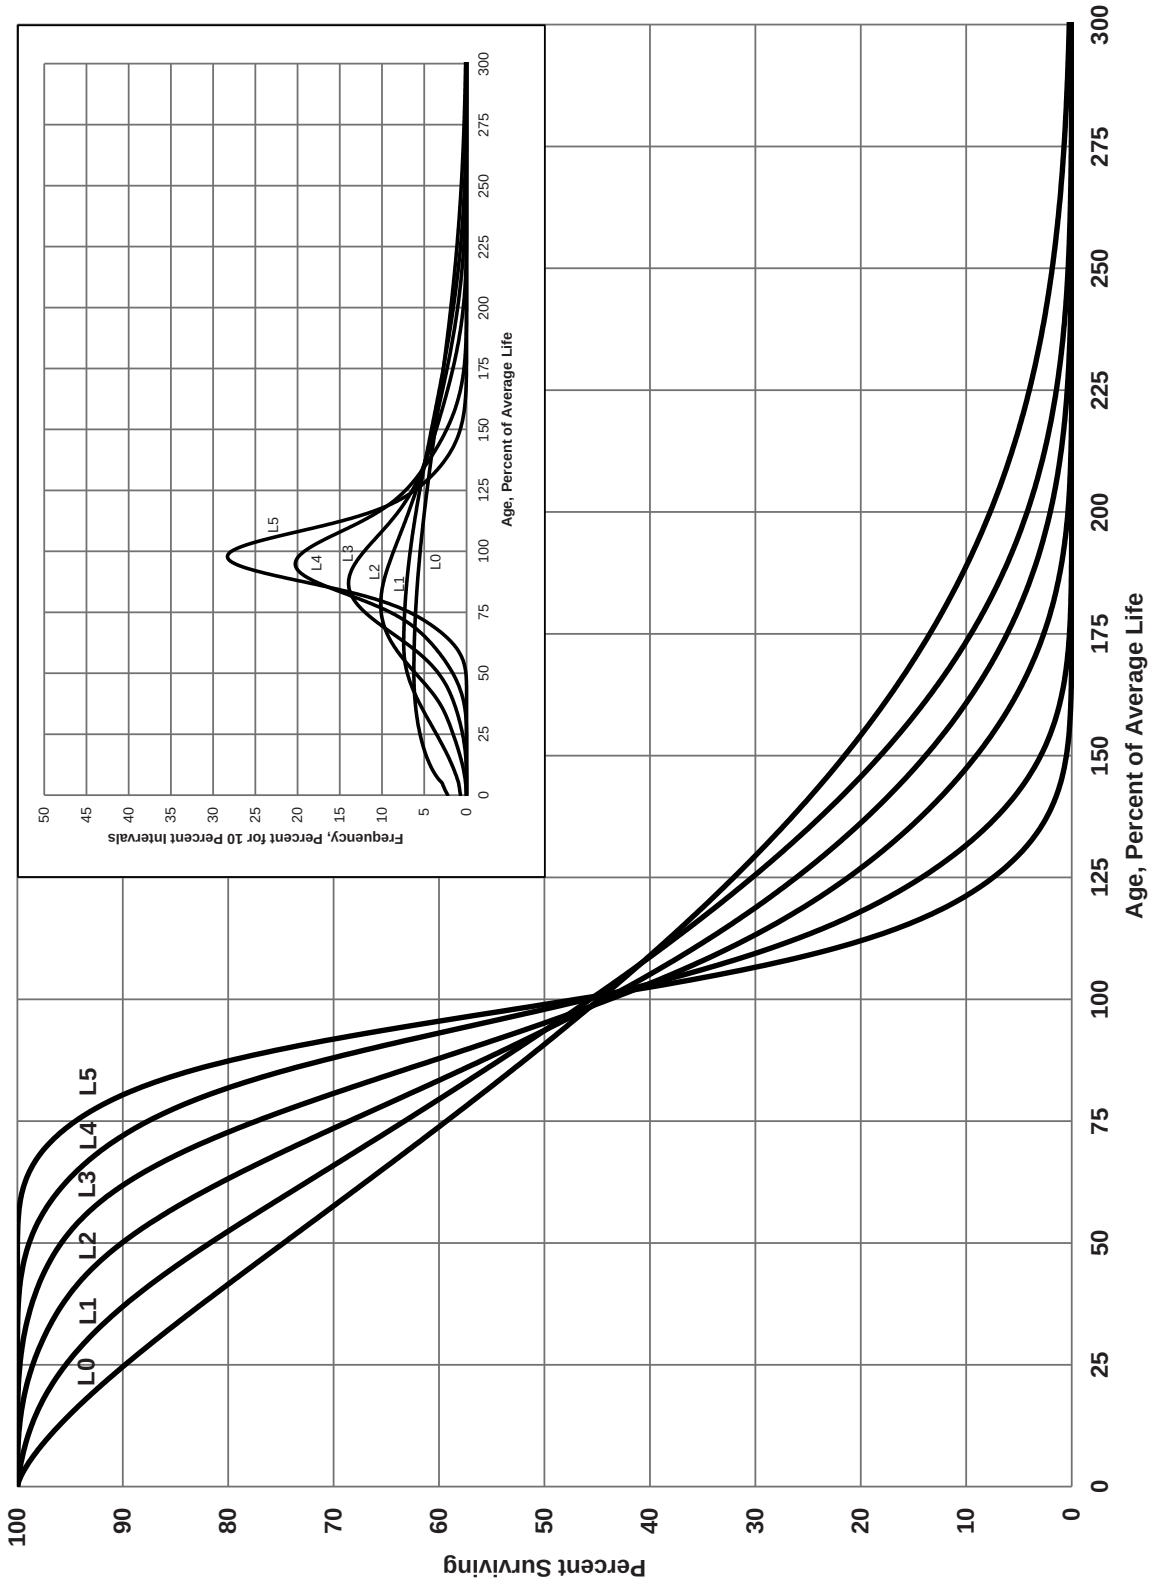

FIGURE 2. LEFT MODAL OR "L" IOWA TYPE SURVIVOR CURVES

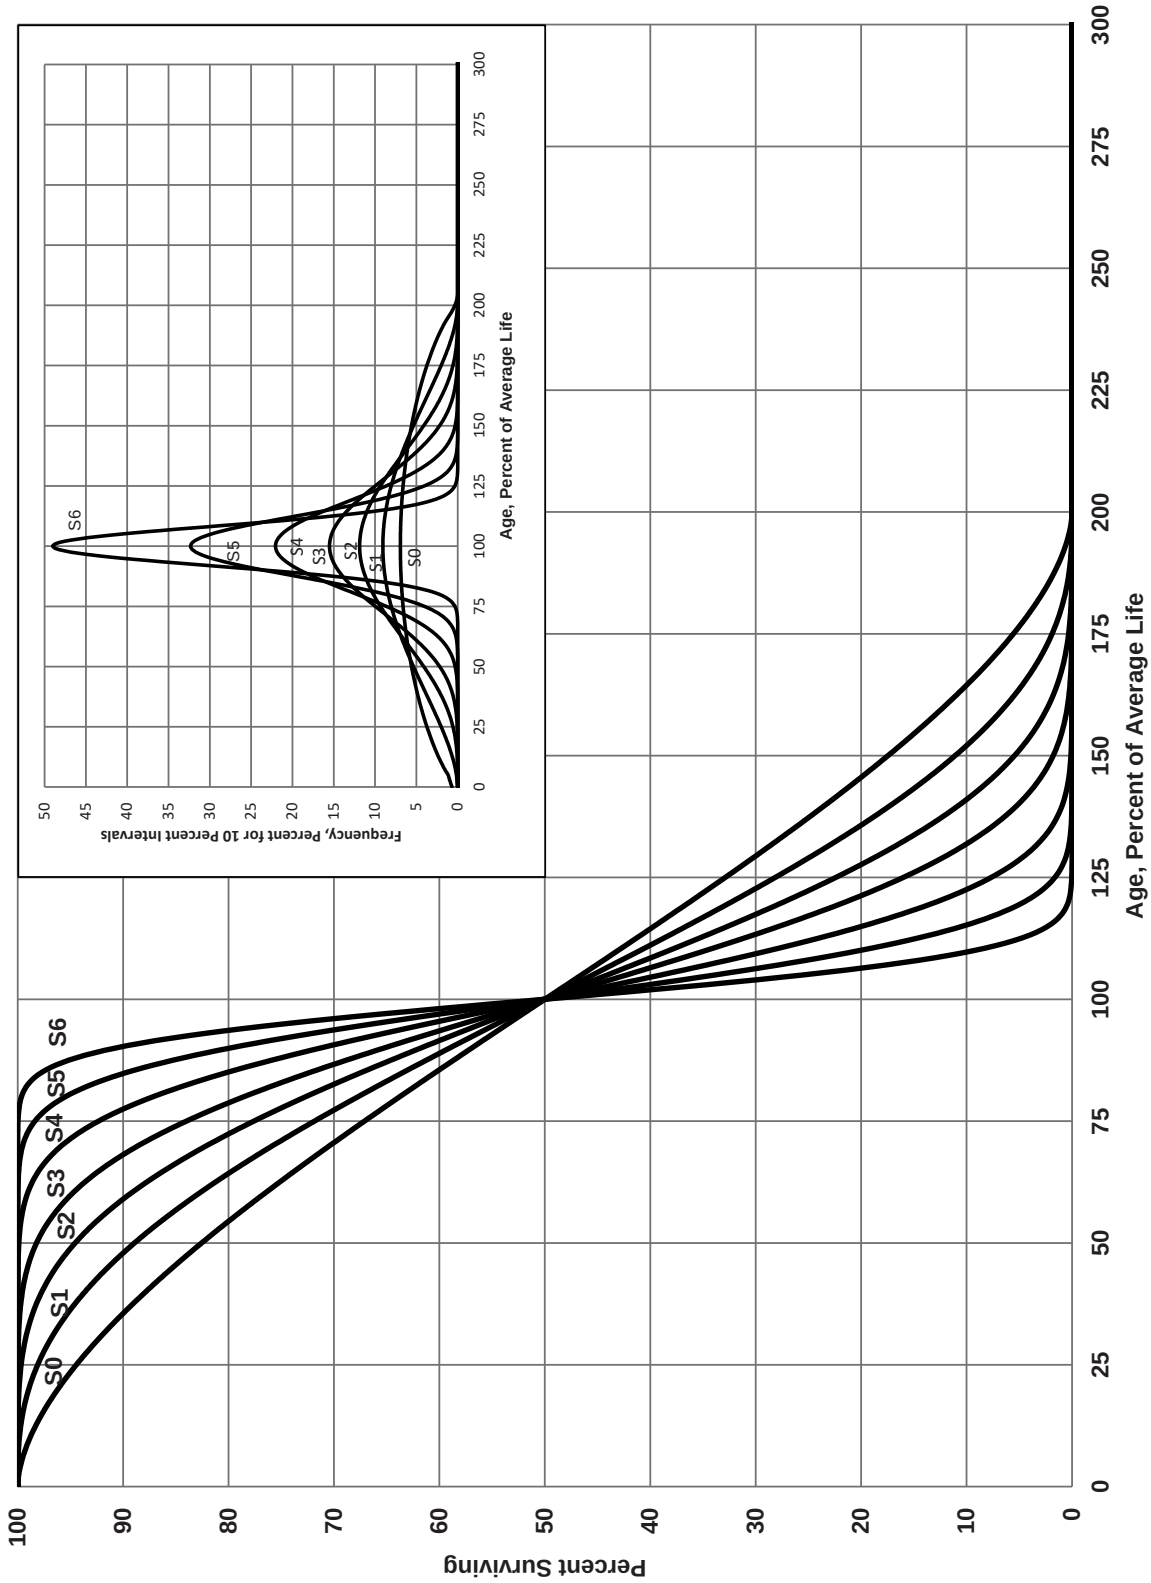

FIGURE 3. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES

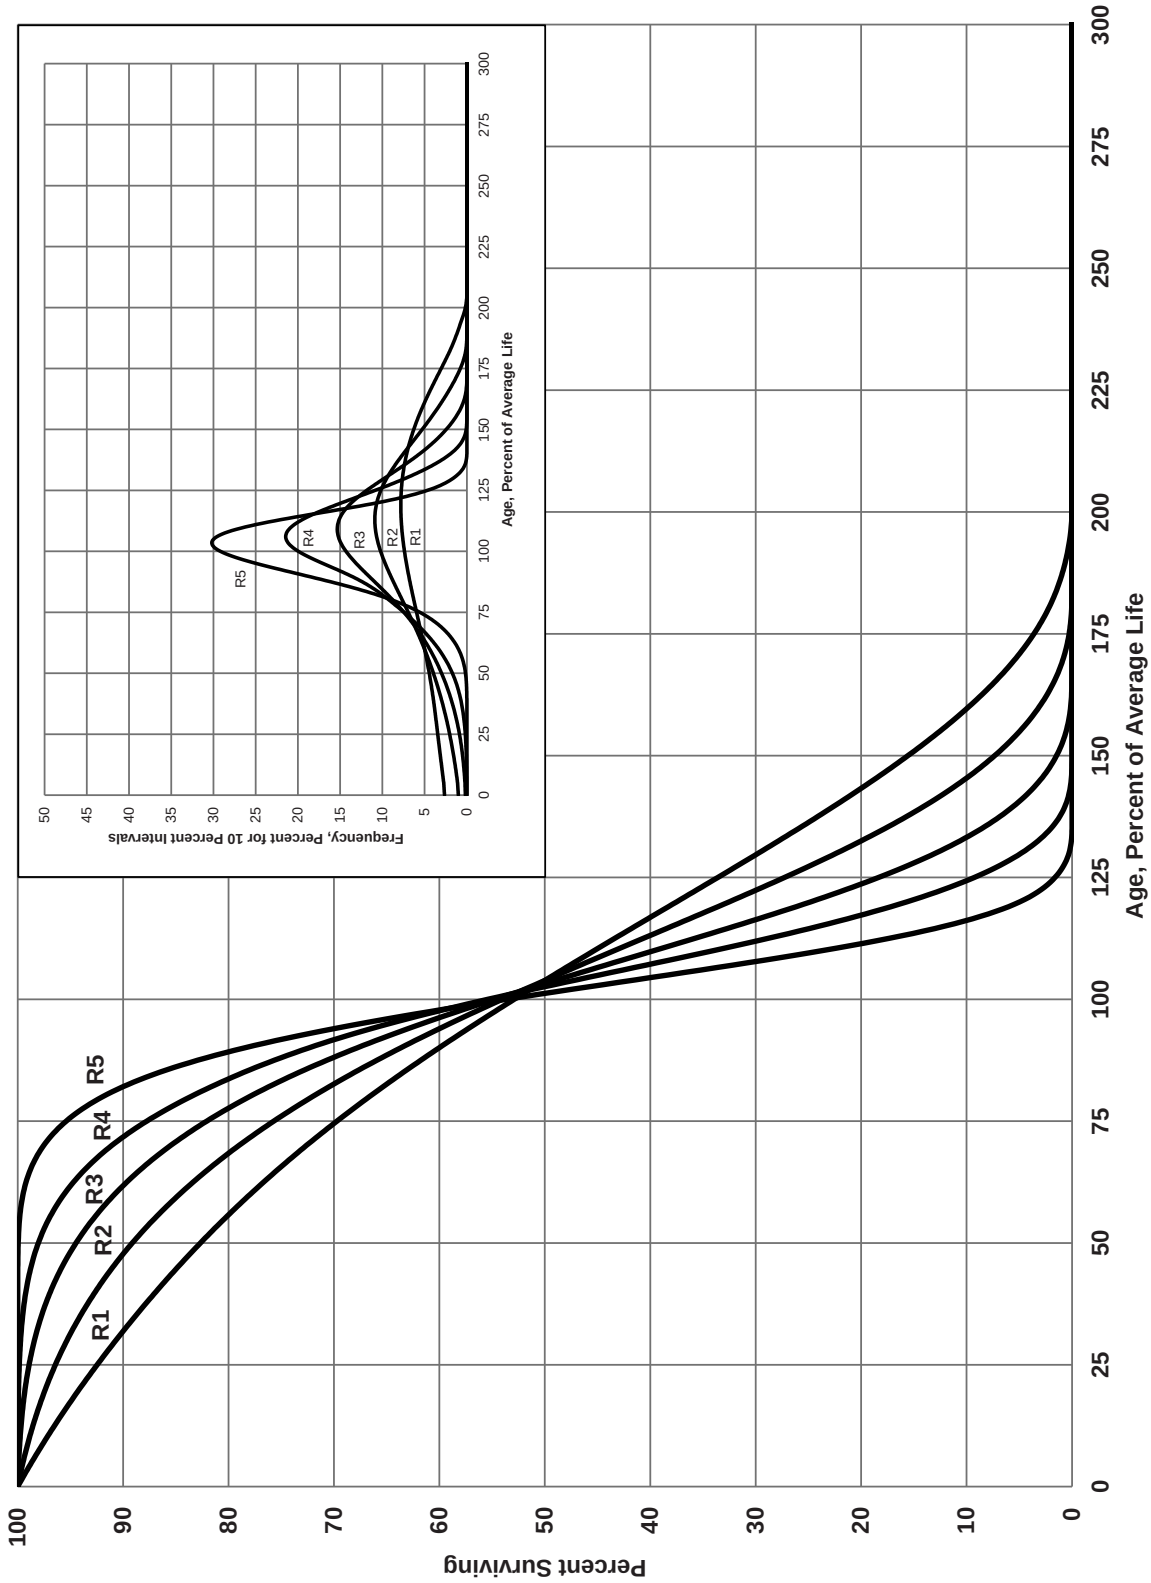

FIGURE 4. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES

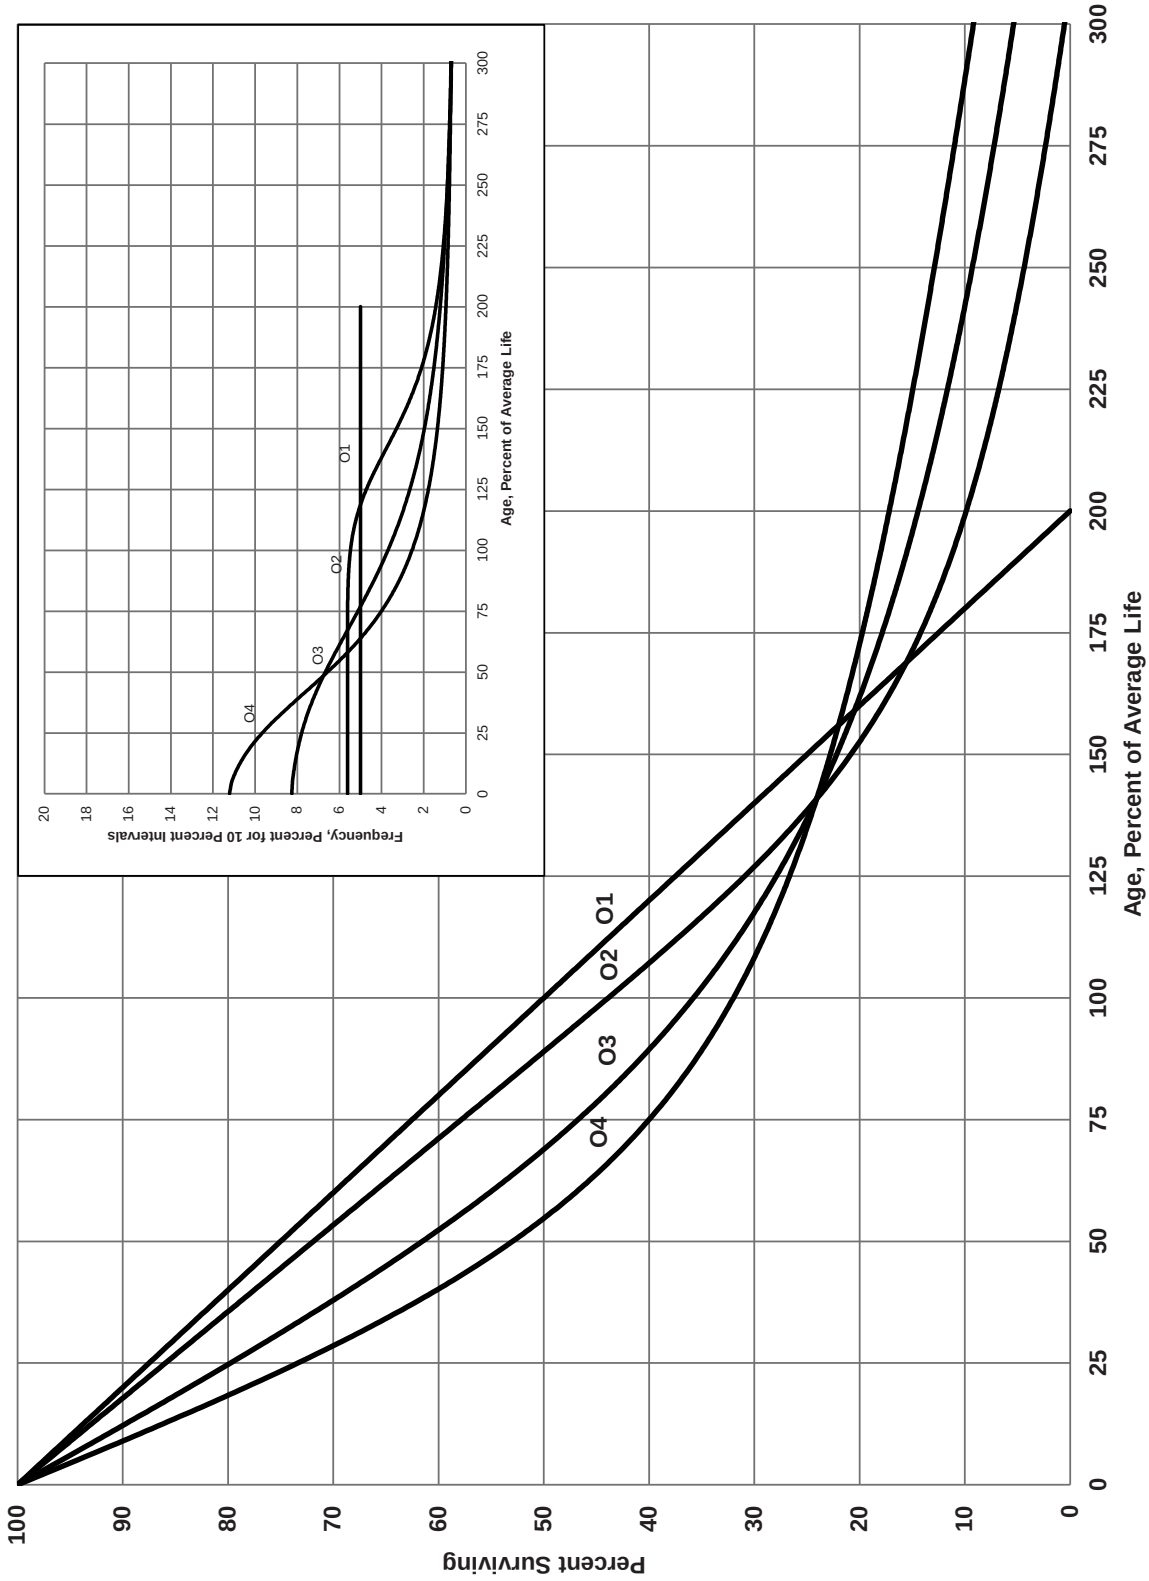

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."[1] In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"[2] "Engineering Valuation and Depreciation,"[3] and "Depreciation Systems."[4]

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2014-2023 for which there were placements during the years 2009-2023. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, $10,000 of the dollars invested in 2009 were retired in 2014. The $10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of $143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2014 retirements of 2009 installations and ending with the 2023 retirements of the 2018 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.

[a] Transfer Affecting Exposures at Beginning of Year
[b] Transfer Affecting Exposures at End of Year
[c] Sale with Continued Use
Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2014 through 2023 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2019 are calculated in the following manner:

Exposures at age 0	= amount of addition	= $750,000
Exposures at age ½	= $750,000 - $ 8,000	= $742,000
Exposures at age 1½	= $742,000 - $18,000	= $724,000
Exposures at age 2½	= $724,000 - $20,000 - $19,000	= $685,000
Exposures at age 3½	= $685,000 - $22,000	= $663,000

SCHEDULE 3. PLANT EXPOSED TO RETIREMENT
JANUARY 1 OF EACH YEAR 2014-2023

2020							850[a]	841	821	799	4,955	2½-3½
2021								960[a]	949	926	5,719	1½-2½
2022									1,080[a]	1,069	6,579	½-1½
2023										1,220[a]	7,490	0-½
Total	1,975	2,382	2,824	3,318	3,872	4,494	5,247	6,017	6,852	7,799	44,780	

[a]Additions during the year

For the entire experience band 2014-2023, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.

Original Life Table

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15				
Exposures at age 4½	=	3,789,000				
Retirements from age 4½ to 5½	=	143,000				
Retirement Ratio	=	143,000	÷	3,789,000	=	0.0377
Survivor Ratio	=	1.000	-	0.0377	=	0.9623
Percent surviving at age 5½	=	(88.15)	x	(0.9623)	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE
CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2014-2023 Placement Band 2009-2023

(Exposure and Retirement Amounts are in Thousands of Dollars)

Age at Beginning of Interval	Exposures at Beginning of Age Interval	Retirements During Age Interval	Retirement Ratio	Survivor Ratio	Percent Surviving at Beginning of Age Interval
(1)	(2)	(3)	(4)	(5)	(6)
0.0	7,490	80	0.0107	0.9893	100.00
0.5	6,579	153	0.0233	0.9767	98.93

11.5	531	64	0.1205	0.8795	55.60
12.5	323	44	0.1362	0.8638	48.90
13.5	167	26	0.1557	0.8443	42.24
					35.66
Total	44,780	1,606			

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.
Column 3 from Schedule 1, Column 12, Retirements for Each Year.
Column 4 = Column 3 Divided by Column 2.
Column 5 = 1.0000 Minus Column 4.
Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

PART III. SERVICE LIFE CONSIDERATIONS

PART III. SERVICE LIFE CONSIDERATIONS

FIELD TRIPS

In order to be familiar with the operation of the Company and observe representative portions of the plant, a field trip was conducted for the study. A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirements are obtained during field trips. This knowledge and information were incorporated in the interpretation and extrapolation of the statistical analyses.

The following is a list of the locations visited during the most recent field trips.

October 1, 2024
- Newman Generating Station
- Stan Roberts Substation
- Copper Substation
- Copper Power Station
- East Side Distribution Operations Center
- El Paso Electric Operations and Training Center
- Montana Power Station
- Mesa Substation
- Triumph Substation

February 24, 2020
- East Side Distribution Operations Center
- Montana Power Substation
- Montana Power Generating Facility
- Caliente Substation
- Pelicano Substation
- Newman Generating Station
- Rio Grande Generating Station

August 18, 2014
- Newman Generating Station
- Rio Grande Generating Station
- Stanton Tower

August 19, 2014
- Wrangler Substation
- Wrangler Solar Facility
- Diamond Head Substation
- East Side Distribution Operations Center
- Montana Power Generating Facility
- Montana Power Substation

February 9, 2009
- Vanderbilt Service Center
- Vista Substation
- Wrangler Substation
- Hawkins Service Center
- Copper Training Center
- Copper Combustion Station
- Roland Lucky Building
- Stanton Building

February 10, 2009
- Rio Grande Generating Station
- Systems Operating Center
- Newman Generation Station

February 19, 2003
- Newman Generating Station
- Systems Operating Center
- Rio Grande Generating Station
- 501 Engineering Building
- Centre Building

February 20, 2003
- Sante Fe Building
- Ascarate Substation
- Copper Combustion Station
- Copper Substation
- Copper Training Facility
- Hawkins Warehouse
- Montwood Substation
- Caliente Substation

SERVICE LIFE ANALYSIS

The service life estimates were based on informed judgment which considered various factors. The primary factors were the statistical analyses of data; current Company policies and outlook as determined during conversations with management;

and the survivor curve estimates from previous studies of this company and other electric companies.

For many of the plant accounts for which survivor curves were estimated, the statistical analyses using the retirement rate method resulted in good to excellent indications of the survivor patterns experienced. These accounts represent 74 percent of depreciable plant. Generally, the information external to the statistics led to no significant departure from the indicated survivor curves for the accounts listed below. The statistical support for the service life estimates is presented in the section beginning on page VII-2.

Account No.	Account Description
STEAM PLANT	
312.00	Boiler Plant Equipment
314.00	Turbogenerator Units
315.00	Accessory Electric Equipment
316.00	Miscellaneous Power Plant Equipment
TRANSMISSION PLANT	
352.00	Structures and Improvements
353.00	Station Equipment
355.00	Wood and Steel Poles
DISTRIBUTION PLANT	
361.00	Structures and Improvements
362.00	Station Equipment
364.00	Poles, Towers and Fixtures
365.00	Overhead Conductors and Devices
366.00	Underground Conduit
367.00	Underground Conductors and Devices
368.00	Line Transformers
370.00	Meters
371.00	Installations on Customers' Premises
GENERAL PLANT	
390.00	Structures and Improvements – Minor Structures
392.10	Transportation Equipment – Cars – Sedans
392.20	Transportation Equipment – Light Duty Vehicles
392.40	Transportation Equipment – Heavy Duty Vehicles
392.50	Transportation Equipment – Trailers
396.00	Power Operated Equipment

Account 312.00, Boiler Plant Equipment, is used to illustrate the manner in which the study was conducted for the generating plant. Aged plant accounting data have been compiled for the years 1993 through 2023. These data have been coded in the course of the Company's normal record keeping according to account or property group, type of transaction, year in which the transaction took place, and year in which the electric plant was placed in service. The retirements, other plant transactions, and plant additions were analyzed by the retirement rate method.

The survivor curve estimate is based on the statistical indications for the period 1993 through 2023. The Iowa 65-R4 is a reasonable fit of the original interim survivor curve. The 65-year service life for interim retirements is reasonable for assets in this account. The 65-year life is shorter than the 70-year life previously used by the Company.

Account 364.00, Poles, Towers and Fixtures, is used to illustrate the manner in which the study was conducted for the mass accounts. Aged retirement and other plant accounting data were compiled through the year 2023. These data were coded in the course of the Company's normal recordkeeping according to plant account or property group, type of transaction, year in which the transaction took place, and year in which the electric plant was placed in service. The data were analyzed by the retirement rate method of life analysis. The survivor curve chart for the account is presented on page VII-71 and the life table for the experience band plotted on the chart follows it.

The historical service life indication for Account 364.00, Poles, Towers and Fixtures is the 45-S2.5 based on the experience band, 1993-2023. The prior survivor curve estimate for Account 364.00, Poles, Towers and Fixtures was the 45-R3. Typical service lives for poles of other electric companies range from 40 to 55 years. The Iowa

45-S2.5 survivor curve reflects the outlook of management, is within the range of service life estimates used by other electric companies and is a reasonable interpretation of the significant portion of the stub survivor curves through age 72.

For Account 365.00, Overhead Conductors and Devices, the estimate of survivor characteristics is based on the 1993-2023 experience band. Most retirements have been due to inadequacy or voltage conversions. Typical service lives for overhead conductors range from 40 to 55 years. The Iowa 48-R2.5 survivor curve is within the range of other estimates, is a reasonable interpretation of the significant portions of the survivor curves through age 76 and reflects the outlook of management.

Life Span Estimates

The life span technique was used for the Company's generation accounts. The life span procedure is appropriate for these accounts since all of the assets within the plant will be retired concurrently. Probable retirement dates were estimated for each power plant. Life spans for each generating station were estimated based on discussions with management regarding future outlook, age and condition of the plant and life spans typically experienced and estimated for similar plants. The life span and probable retirement dates used for each generating unit are as follows:

Depreciable Group	Major Year in Service	Probable Retirement Year	Life Span
Steam Production Plant			
Rio Grande #6	1957	2025	68
Rio Grande #7	1958	2026	68
Rio Grande #8	1973	2033	60
Newman #1	1959	2026	67
Newman #2	1962	2027	65
Newman #3	1966	2034	68
Newman #4	1975	2031	56
Newman #5	2009	2045	36
Newman Zero Liquid Discharge	2011	2045	34
Gas Turbine Plant			
Copper	1980	2030	50
Rio Grande #9	2013	2045	32
Montana Power #1	2015	2045	30
Montana Power #2	2015	2045	30
Montana Power #3	2016	2045	29
Montana Power #4	2016	2045	29

Power plants typically are retired when there are other units that can generate electricity at a lower cost. Typical life spans for base load, steam power plants have been 50 to 65 years in the past. For example, Units 6, 7 and 8 at Rio Grande were completed in 1957, 1958 and 1973, respectively. The estimated probable retirement dates for Rio Grande are 2025, 2026 and 2033. Thus, the life spans estimated for the Rio Grande steam units are 68 years for Unit 6, 68 years for Unit 7 and 60 years for Unit 8, which are within, or slightly longer than, the typical range. The estimated retirement dates should not be interpreted as commitments to retire these plants on these dates, but rather, as reasonable estimates subject to modification in the future as circumstances dictate. However, environmental regulations will impact decisions for closures which will lead to shorter life spans for facilities built in recent years.

For all production accounts, an interim survivor curve was estimated for each account, since interim retirements, i.e., retirements prior to the final retirement, are experienced in such accounts.

Similar studies were performed for the remaining plant accounts. Each of the judgments represented a consideration of statistical analyses of aged plant activity, management's outlook for the future, and the typical range of lives used by other electric companies.

The selected amortization periods for other general plant accounts are described in the section "Calculated Annual and Accrued Amortization."

PART IV. NET SALVAGE CONSIDERATIONS

PART IV. NET SALVAGE CONSIDERATIONS

NET SALVAGE ANALYSIS

The estimates of net salvage by account were based in part on historical data compiled for the years 1993 through 2023. Cost of removal and gross salvage were expressed as percents of the original cost of plant retired, both on annual and three-year moving average bases. The most recent five-year average also was calculated for consideration. The net salvage estimates by account are expressed as a percent of the original cost of plant retired.

Net Salvage Considerations

The estimates of future net salvage are expressed as percentages of surviving plant in service, i.e., all future retirements. In cases in which removal costs are expected to exceed salvage receipts, a negative net salvage percentage is estimated. The net salvage estimates were based on judgment which incorporated analyses of historical cost of removal and gross salvage data, expectations with respect to future removal requirements and markets for retired equipment and materials.

The analyses of historical cost of removal and gross salvage data are presented in the section titled “Net Salvage Statistics” for the plant accounts for which the net salvage estimate relied partially on those analyses.

Statistical analyses of historical data for the period 1993 through 2023 contributed significantly toward the net salvage estimates for 14 plant accounts, representing 49 percent of the depreciable plant, as follows:

STEAM PRODUCTION PLANT

312.00	Boiler Plant Equipment
314.00	Turbogenerator Units
315.00	Accessory Electric Equipment
316.00	Miscellaneous Power Plant Equipment

TRANSMISSION PLANT	
353.00	Station Equipment
355.00	Wood and Steel Poles
356.00	Overhead Conductors and Devices
DISTRIBUTION PLANT	
365.00	Overhead Conductors and Devices
367.00	Underground Conductors and Devices
368.00	Line Transformers
370.00	Meters
371.00	Installations on Customers' Premises
373.00	Street Lighting and Signal Systems
GENERAL PLANT	
396.00	Power Operated Equipment

Account 367.00, Underground Conductors and Devices, will be used to illustrate the manner in which the study was conducted for most mass plant accounts. Net salvage data were compiled for the years 1993 through 2023. These data include the retirements, cost of removal and gross salvage.

Discussions with management indicated that retired underground conductors are either reused or sold for scrap. The previous estimate of net salvage for underground conductors was negative 20 percent. The range of typical net salvage estimates used by other electric companies for underground conductors is negative 10 percent to negative 30 percent.

The net salvage estimate for this account is negative 30 percent and is based on the current practices in place for recording cost of removal and gross salvage. Cost of removal as a percent of the original cost retired averaged around 35 percent through the 1990s, then went to 0 percent starting in 2002 when recording practices changed. In 2013, a new practice for recording cost of removal was started and will continue into the future. Gross salvage was generally between 5 and 30 percent during the 1990s, then also went to 0 percent in 2002. Then new practices were implemented in 2013

which will continue into the foreseeable future, therefore, the most recent period is the best indicator of the future. The overall net salvage percent is negative 38 percent. The most recent five-year average for net salvage indicates negative 76 percent. Given the overall statistical indications, most recent five-year average and the estimates of others, a negative 30 percent net salvage was utilized.

The overall net salvage estimates for the Company's production facilities, for which the life span method is used, are based on estimates of both final net salvage and interim net salvage. Final net salvage is the net salvage experienced at the end of a production plant's life span. Interim net salvage is the net salvage experienced for interim retirements that occur prior to the final retirement of the plant. The final net salvage estimates in the study were based on decommissioning analyses incorporating a $/kW estimate that was consistent with similar facilities determined by a variety of engineering specialists. The interim net salvage estimates were based in part on analysis of historical interim retirement and net salvage data. Based on informed judgment that incorporated these interim net salvage analyses for each plant account, an interim net salvage estimate of negative 5 percent was used for all steam plant accounts, and a negative 5 percent estimate was used for gas turbine plant accounts.

The interim survivor curve estimates for each account and production facility were used to calculate the percentage of plant expected to be retired as interim retirements and final retirements. These are shown on Table 2 in the Net Salvage Statistics section on page VIII-2. These percentages were used to determine the weighted net salvage estimate for each account and production facility based on the interim and final net salvage estimates. The calculations, as well as the estimated final net salvage amounts and interim net salvage percents, are shown on Table 3 of the Net Salvage Statistics section on page VIII-3.

The net salvage estimates for most of the remaining accounts were estimated using the above-described process incorporating judgment, historical indications and review of the typical range of estimates used by other electric companies. The results of the net salvage analysis for each plant account are presented in account sequence beginning in the section titled “Net Salvage Statistics,” page VIII-2.

Generally, the net salvage estimates for the general plant accounts were zero percent, consistent with amortization accounting.

PART V. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

PART V. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

GROUP DEPRECIATION PROCEDURES

A group procedure for depreciation is appropriate when considering more than a single item of property. Normally the items within a group do not have identical service lives but have lives that are dispersed over a range of time. There are two primary group procedures, namely, average service life and equal life group. In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

Single Unit of Property

The calculation of straight line depreciation for a single unit of property is straightforward. For example, if a $1,000 unit of property attains an age of four years and has a life expectancy of six years, the annual accrual over the total life is:

$$\frac{\$1{,}000}{(4 + 6)} = \$100 \text{ per year.}$$

The accrued depreciation is:

$$\$1{,}000\left(1 - \frac{6}{10}\right) = \$400.$$

Remaining Life Annual Accruals

For the purpose of calculating remaining life accruals as of June 30, 2025, the depreciation reserve for each plant account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation follow. The detailed calculations as of June 30, 2025, are set forth in the Results of Study section of the report.

Average Service Life Procedure

In the average service life procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the average remaining life of the vintage. The average remaining life is a directly weighted average derived from the estimated future survivor curve in accordance with the average service life procedure.

The calculated accrued depreciation for each depreciable property group represents that portion of the depreciable cost of the group which would not be allocated to expense through future depreciation accruals if current forecasts of life characteristics are used as the basis for such accruals. The accrued depreciation calculation consists of applying an appropriate ratio to the surviving original cost of each vintage of each account based upon the attained age and service life. The straight line accrued depreciation ratios are calculated as follows for the average service life procedure:

$$Ratio = 1 - \frac{Average\ Remaining\ Life}{Average\ Service\ Life}.$$

CALCULATION OF ANNUAL AND ACCRUED AMORTIZATION

Amortization is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized. Normally, the distribution of the amount is in equal amounts to each year of the amortization period.

The calculation of annual and accrued amortization requires the selection of an amortization period. The amortization periods used in this report were based on judgment which incorporated a consideration of the period during which the assets will render most of their service, the amortization period and service lives used by other utilities, and the service life estimates previously used for the asset under depreciation accounting.

Amortization accounting is proposed for a number of accounts that represent numerous units of property but a very small portion of depreciable electric plant in service. The accounts and their amortization periods are as follows:

ACCT	TITLE	AMORTIZATION PERIOD, YEARS
391.00	Office Furniture and Equipment	20
393.00	Stores Equipment	25
394.00	Tools, Shop and Garage Equipment	25
395.00	Laboratory Equipment	15
397.30	Communication Equipment	15
398.00	Miscellaneous Equipment	15

For the purpose of calculating annual amortization amounts as of June 30, 2025, the book depreciation reserve for each plant account or subaccount is assigned or allocated to vintages. The book reserve assigned to vintages with an age greater than the amortization period is equal to the vintage's original cost. The remaining book

reserve is allocated among vintages with an age less than the amortization period in proportion to the calculated accrued amortization. The calculated accrued amortization is equal to the original cost multiplied by the ratio of the vintage's age to its amortization period. The annual amortization amount is determined by dividing the future amortizations (original cost less allocated book reserve) by the remaining period of amortization for the vintage.

PART VI. RESULTS OF STUDY

PART VI. RESULTS OF STUDY

QUALIFICATION OF RESULTS

The calculated annual and accrued depreciation are the principal results of the study. Continued surveillance and periodic revisions are normally required to maintain continued use of appropriate annual depreciation accrual rates. An assumption that accrual rates can remain unchanged over a long period of time implies a disregard for the inherent variability in service lives and net salvage and for the change of the composition of property in service. The annual accrual rates were calculated in accordance with the straight line remaining life method of depreciation, using the average service life procedure based on estimates which reflect considerations of current historical evidence and expected future conditions.

The annual depreciation accrual rates are applicable specifically to the electric plant in service as of June 30, 2025. For most plant accounts, the application of such rates to future balances that reflect additions subsequent to June 30, 2025, is reasonable for a period of three to five years.

DESCRIPTION OF DETAILED TABULATIONS

Table 1 is a summary of the results of the study as applied to the original cost of electric plant as of June 30, 2025 presented on pages VI-4 through VI-8 of this report.

The service life estimates were based on judgment that incorporated statistical analysis of retirement data, discussions with management and consideration of estimates made for other electric utilities. The results of the statistical analysis of service life are presented in the section beginning on page VII-2, within the supporting documents of this report.

For each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table(s) plotted on the chart. The survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the curve type designation. The numeral used is the average life derived from the entire curve from 100 percent to zero percent surviving. The titles of the chart indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which were plotted. The experience band indicates the range of years for which retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The analyses of net salvage data are presented in the section titled, “Net Salvage Statistics.” The tabulations present annual cost of removal and gross salvage data, three-year moving averages and the most recent five-year average. Data are shown in dollars and as percentages of original costs retired.

The tables of the calculated annual depreciation applicable to depreciable assets as of June 30, 2025 are presented in account sequence starting on page IX-2 of the supporting documents. The tables indicate the estimated survivor curve and net salvage percent for the account and set forth, for each installation year, the original cost, the calculated accrued depreciation, the allocated book reserve, future accruals, the remaining life, and the calculated annual accrual amount.

EL PASO ELECTRIC COMPANY

TABLE 1. SUMMARY OF ESTIMATED SURVIVOR CURVE, NET SALVAGE PERCENT, ORIGINAL COST, BOOK DEPRECIATION RESERVE AND CALCULATED ANNUAL DEPRECIATION ACCRUALS RELATED TO ELECTRIC PLANT AS OF JUNE 30, 2025

DEPRECIABLE GROUP	PROBABLE RETIREMENT DATE	SURVIVOR CURVE	NET SALVAGE PERCENT	ORIGINAL COST AS OF JUNE 30, 2025	BOOK DEPRECIATION RESERVE	FUTURE ACCRUALS	CALCULATED ANNUAL ACCRUAL AMOUNT	CALCULATED ANNUAL ACCRUAL RATE	COMPOSITE REMAINING LIFE

SCHEDULE C-3: DEPRECIATION AND AMORTIZATION METHODS
SPONSOR: CYNTHIA S. PRIETO
PREPARER: MAGDALENA RODRIGUEZ
FOR THE BASE AND TEST YEAR PERIODS ENDED SEPTEMBER 30, 2025

El Paso Electric Company ("EPE") currently uses a straight-line group method based on estimated service lives and net salvage rates to calculate a depreciation expense accrual on depreciable property. All equipment is depreciated over the estimated period in which the asset is expected to provide a benefit to the ratepayer. Depreciation of tangible utility plant is charged to FERC Account 403, *Depreciation Expense* , with the exception of transportation equipment, a portion of which is charged to a clearing account (184) in order to arrive at the appropriate distribution of expense between CWIP and O&M.

Amortization of software and other intangibles is calculated on a straight-line basis over the expected service life for each system and/or software package. Historically, the related amortization expense was recorded in FERC Account 404 (Amortization Expense). However, pursuant to FERC Order 898, effective January 2025, amortization is recorded in FERC Account 403 (Depreciation Expense).

The recorded cost of depreciable plant retired and the cost of removal less salvage is charged to accumulated provision for depreciation.

Schedule H-7 includes the requested depreciation expense using the rates determined in the Company's most recent depreciation study which is based on depreciable plant balances as of June 30, 2025 and is sponsored by EPE Witness John Spanos. Refer to Schedule C-2 for the current study.

SCHEDULE D-1: ORIGINAL COST OF PLANT

Note:
(1) As of the end of September 2024, the Company had available a $550 million revolving credit facility (RCF) with a term ending on May 5, 2028. EPE has the option available to extend the RCF by an additional one year period. The RCF is available for nuclear fuel borrowings and for general corporate purposes. The borrowings identified on Schedule G-4 are for general corporate purposes and exclude nuclear fuel borrowings. Alternate Base Rate (ABR) is the calculated daily interest rate at which funds are borrowed.

7	2021	1,310,993,031	146,215,108	(128,376,000)	(D)	1,328,832,139	
8	2022	1,328,832,139	113,320,079	(162,717,000)	(D)	1,279,435,218	
9	2023	1,279,435,218	208,595,442	(180,147,000)	(D)	1,307,883,660	
10	2024	1,307,883,660	172,030,534	(148,956,000)	(D)	1,330,958,194	
Base Period	202509	1,437,927,749	155,190,301	(152,955,000)	(D)	1,440,163,050	

Additional Notes:

(A) Amounts included do not reflect the Company's approved application with both the New Mexico Public Regulation Commission and Federal Energy Regulatory Commission to issue shares of common stock, including the reissuance of treasury shares, in an amount up to $200.0 million in one or more transactions.

(B) Upon closing of the Merger with IIF US 2 on July 29, 2020, each share of common stock of the Company including outstanding and unvested restricted stock and unvested performance stock of the Company was cancelled and converted into the right to receive $68.25 in cash, without interest. Per the Certificate of the Merger, the total number of shares the Company is authorized to issue is 1,000. The par value of each of the authorized shares is $0.01 per share. Balance in Paid In Capital prior to the Merger was eliminated.

(C) Represents adjustment of $11,579,314 related to Merger and dividends paid of $57,757,671.

(D) Represents dividends paid.

(E) Amounts may not add or tie to other schedules due to rounding.

(1) Beginning in 2015, shares of the Company's common stock issued for employee benefit and stock incentive plans have been issued from the shares repurchased and held in treasury stock, except for 6,356 shares awarded in 2015 per the employment separation agreements.

(2) Represents 2014 LTIP performance stock vested.

(3) Represents the cancellation of 1,400,000 shares of treasury stock.

(4) Additions were reduced for unearned compensation recorded on restricted stock grants.

(5) Represents equity contribution from Sun Jupiter Holdings, LLC, the parent company of the Company.

(6) Represents stock awards withheld for taxes of $15,031 and forfeitures of restricted common stock of $12,215.

(7) Represents stock awards withheld for taxes of $5,723 and forfeitures of restricted common stock of $298.

(8) Represents stock awards withheld for taxes of $5,258.

(9) Represents stock awards withheld for taxes of $555,516 and forfeitures of restricted common stock of ($22,295).

(10) Represents stock awards withheld for taxes of $260,567 and forfeitures of restricted common stock of ($3,282).

(11) Represents stock awards withheld for taxes of $568,350 and forfeitures of restricted common stock of ($82,650).

(12) Represents reclassification from account 207000 to 210000 of $3,027,514 related to restricted stock issued from the shares repurchased and held in treasury stock since 2015 through 2017.

(13) Represents dividends paid of $53,337,470 and a cumulative effect adjustment to retained earnings of ($182,628) as a result of the adoption of Accounting Standards Update ("ASU") 2016-09, Compensation - Stock Compensation (Topic 718) - Improvements to Employee Share-Based Payment Accounting - Federal Income Tax.

(14) Represents dividends paid of $57,539,118 and a cumulative effect adjustment to retained earnings of ($40,724,356) as a result of the adoption of ASU 2016-01, Financial Instruments - Overall (Subtopic 825-10) - Recognition and Measurement of Financial Assets - Net of Income Tax.

(15) Represents dividends paid of $61,718,056 and $16,372,067 related to cancellation of 1.4 million shares of treasury stock.

Please refer to the Direct Testimony of EPE witness Jennifer E. Nelson.

All adjustments are presented and summarized by FERC account in WP A-3.
(1) The Company's payroll adjustment is presented in WP A-3, Adjustment No. 3.
(2) The Company's non-payroll cost of service adjustments are presented in WP A-3, Adjustment Nos. 1, 2 and 4 through 27.

(A) Amounts may not add or tie to other schedules due to rounding.
(B) Refer to Steven Sierra's testimony for adjustment amounts.
*EPE does not track payroll costs related to litigation separately

FOR THE BASE AND TEST YEAR ENDED SEPTEMBER 30, 2025

Line No.	Description		Base Period (A)		Test Year Period (B)
	UNIT COST PER MMBTU				
	GAS				
1	Fuel Cost	$	105,406,934	$	105,150,859
2	MMBTU Used		60,167,211		59,756,111
3	Unit Cost per MMBTU	$	1.75	$	1.76
	COAL				
4	Fuel Cost	$	156,108 (C)	$	156,108
5	MMBTU Used		0		0
6	Unit Cost per MMBTU	$	0	$	0
	NUCLEAR				
7	Fuel Cost	$	31,066,671 (D)	$	21,308,883
8	MMBTU Used		52,036,940		33,311,767
9	Unit Cost per MMBTU	$	0.60	$	0.64
	DIESEL				
10	Fuel Cost	$	31,448	$	31,448
11	MMBTU Used		2,185		2,185
12	Unit Cost per MMBTU	$	14.39	$	14.39

Notes:

(A) Represents Base Period fuel costs for the period October 2024, through September 2025 excluding any supplier-related refunds and all purchased power expense.

(B) Represents Test Year Period fuel costs for the period October 2024 through September 2025, excluding all purchased power expense. Refer to Schedule A-3, Adjustment No. 2, Fuel and Purchased Power Expense.

(C) NMPRC Case No. 20-00104-UT approved the Company's request to recover coal reclamation costs over a seven-year period beginning July 2021 through June 2028, consistent with the NMPRC's final order in NMPRC Case No. 15-00109-UT. Includes $13,009 per month related to coal reclamation costs.

(D) Represents the total Company cost of nuclear fuel for Palo Verde Units 1, 2 and 3.

Notes:

(A) NMPRC Case No. 20-00104-UT approved the Company's request to recover coal reclamation costs over a seven-year period beginning July 2021 through June 2028, consistent with the NMPRC's Final Order in NMPRC Case No. 15-00109-UT. Includes $13,009 per month related to coal reclamation costs.

(B) Pursuant to the Final Order in NMPRC Case No. 21-00064-UT, EPE was authorized to amortize uncollected amounts of the $5.7 million of incremental FPPCAC costs from the Severe Winter Event over a twelve-month period, from July 2024 through June 2025. Includes $476,131 per month for the period of October 2024 through June 2025.

In addition, May 2025 through September 2025 includes a credit of $600,230 per month. This represents the amortization of Hecate Solar penalty credits over a two-year period, from May 2025 - April 2027, in accordance with the EPE Exhibit 1 (Schichtl Direct) at pages 20-21 in NMPRC Case No. 25-00038-UT - Application for Approval of El Paso Electric Company's Renewable Energy Act Plan for 2026, and Ninth Revised Rate No. 38 - RPS Cost Rider.

(C) Effective July 2016, pursuant to NMPRC Case No. 15-00127-UT, El Paso Electric was required to remove all fuel and purchased power costs from base rates and include such costs through the Fuel and Purchased Power Cost Adjustment Clause (FPPCAC).

(D) Represents the allocation of Milagro Solar energy generated in May 2025 to the New Mexico jurisdiction for Renewable Procurement Standard compliance purposes per NMPRC Case No. 24-00176-UT.

New Mexico jurisdictional amounts are reported in the NMPRC 550 monthly reports submitted to the Commission.

Notes:

[1] Transportation is depreciated from seven to twelve years.

[2] Computer software is amortized from five to fifteen years and is not included in the 2025 Gannett Fleming Depreciation Study.

[3] Excludes non-depreciable land.

[4] Depreciation expense on the Palo Verde Generating Station is calculated using the revaluation methodology approved in NMPRC Case No. 2722 and is not included in the 2025 Gannett Fleming Depreciation Study.

[5] Asset is fully depreciated.

Amounts may not add or tie to other schedules due to rounding.

Notes:
Amounts may not add or tie to other schedules due to rounding.

FOOTNOTE EXPLANATIONS:

(A) Adjusted to reflect payroll levels in Test Year Period. See WP/A-3, Adjustment 17, page 2, line 18, column (b).

(B) Adjustments to record ad valorem taxes at a rate consistent with plant in service values for the Test Year Period.

(C) Adjustments to record revenue related taxes at levels consistent with revenues as Adjusted Under Current Rates and in the Test Year Period. See WP/A-3 Adjustments 18 to 22, line 5, column (b).

(D) Adjustment related to Palo Verde payroll taxes.
See WP/A-3 Adjustment 17, column (b), sum of lines 2 and 3.

(E) Regulatory Commission Fees recorded in FERC Account 928000, pursuant to FERC Docket No. PA19-3-00.
The total on line 24, column (b), less the Regulatory Commission Fees, ties to Schedule A, line 22, column (b).

SCHEDULE H-11: CONSOLIDATED FEDERAL RETURN
SPONSOR: TAMERA L. HENDERSON
PREPARER: SUSI BARRON
FOR THE BASE AND TEST YEAR PERIODS ENDED SEPTEMBER 30, 2025

This schedule is not applicable. EPE files its income taxes as a corporation and as a party to a consolidated group. EPE is a wholly-owned subsidary of Sun Jupiter Holdings, LLC. Although EPE is part of a consolidated return for federal and state income tax filings, it continues to calculate its utility taxes on a stand-alone basis.

3			Total	$ 454,540	$ -	$ 454,540

[A] JP Morgan Chase (JPM) is listed as an affiliate to ensure compliance with commitments made by EPE in Docket No. 19-00234-UT, paragraph 70(b). These transactions were arms-length and negotiated prior to the merger. EPE completed the transition of its primary operating account from JPM to Wells Fargo Bank N.A. (Wells Fargo) in November 2025.

NOT APPLICABLE

See Schedule A-3, related workpapers, and the Direct Testimony of EPE witness Steven Sierra for explanations and amounts of the cost of service adjustments.

(B) Includes net cash from operations excluding depreciation and amortization.

(C) Equity contributions to be provided by Sun Jupiter Holdings LLC in order for EPE to balance its capital structure and support credit ratings. There are no issuance costs for the equity contributions.

(D) Short-term debt borrowings on EPE's $550 million Revolving Credit Facility (RCF) to manage working capital and for general corporate purposes.

(E) Other non-operating activities includes a reduction for dividends.
