

Newman Unit 6

- The proposal and development of Newman Unit 6 will meet the growing customer demand for energy and allow EPE to provide the reliability customers expect. Importantly, the new unit will allow future decommissioning of more costly, older, less efficient and less reliable generating units
- Newman Unit 6 is only one piece of our future generation portfolio and remains a critical resource for all El Paso Electric (EPE) customers now and for those in the future
 - **Air Permit**
 - Newman Unit 6 will be equipped with state-of-the-art air pollution control reducing emissions of ozone precursors by 95% compared to the older units
 - Newman Unit 6's greater efficiency reduces natural gas consumption and water consumption by 600 million gallons per year
 - EPE is continuing through the air permit approval process for Newman Unit 6 and stands by the merits of the permit application. EPE will continue to meet all regulatory requirements and work with all parties to do so
